[25524] GAM1832 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1832 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1832 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1832 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1832 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or

in both 3UTR and 5UTR regions.

[25525] The complementary binding of GAM1832 RNA, herein designated GAM RNA, to target binding sites on GAM1832 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1832 target RNA, herein designated GAM TARGET RNA, into GAM1832 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[25526] It is appreciated that GAM1832 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1832 target genes. The mRNA of each one of this plurality of GAM1832 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1832 RNA, herein designated GAM RNA, and which when bound by GAM1832 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1832 target proteins.

[25527] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1832 gene, herein designated GAM GENE, on one or more GAM1832 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes

are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[25528] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1832 correlate with, and may be deduced from, the identity of the target genes which GAM1832 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[25529] Nucleotide sequences of the GAM1832 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1832 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1832 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1832 are further described hereinbelow with reference to Table 1.

[25530] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1832 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[25531] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1833 (GAM1833) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[25532] GAM1833 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1833 was detected is described hereinabove with reference to Figs. 2-8.

[25533] GAM1833 gene, herein designated GAM GENE, and GAM1833 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[25534] GAM1833 gene, herein designated GAM GENE, encodes a GAM1833 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1833 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1833 precursor RNA is designated SEQ ID:1810, and is provided hereinbelow with reference to the sequence listing part.

[25535] GAM1833 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1833 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[25536] An enzyme complex designated DICER COMPLEX, dices the GAM1833 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1833 RNA, herein designated GAM RNA, a single stranded

~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 81%) nucleotide sequence of GAM1833 RNA is designated SEQ ID:4416, and is provided hereinbelow with reference to the sequence listing part.

[25537] GAM1833 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1833 target RNA, herein designated GAM TARGET RNA. GAM1833 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[25538] GAM1833 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1833 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1833 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1833 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1833 target RNA, herein designated GAM

TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[25539] The complementary binding of GAM1833 RNA, herein designated GAM RNA, to target binding sites on GAM1833 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1833 target RNA, herein designated GAM TARGET RNA, into GAM1833 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[25540] It is appreciated that GAM1833 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1833 target genes. The mRNA of each one of this plurality of GAM1833 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1833 RNA, herein designated GAM RNA, and which when bound by GAM1833 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1833 target proteins.

[25541] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1833 gene, herein designated GAM GENE, on one or more GAM1833 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with

reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[25542] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1833 correlate with, and may be deduced from, the identity of the target genes which GAM1833 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[25543] Nucleotide sequences of the GAM1833 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1833 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1833 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1833 are further described hereinbelow with reference to Table 1.

[25544] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1833 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[25545] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as

Genomic Address Messenger 1834 (GAM1834) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[25546] GAM1834 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1834 was detected is described hereinabove with reference to Figs. 2-8.

[25547] GAM1834 gene, herein designated GAM GENE, and GAM1834 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[25548] GAM1834 gene, herein designated GAM GENE, encodes a GAM1834 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1834 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1834 precursor RNA is designated SEQ ID:1811, and is provided hereinbelow with reference to the sequence listing part.

[25549] GAM1834 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1834 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[25550] An enzyme complex designated DICER COMPLEX, dices the GAM1834 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1834 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM1834 RNA is designated SEQ ID:4415, and is provided hereinbelow with reference to the sequence listing part.

[25551] GAM1834 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1834 target RNA, herein designated GAM TARGET RNA. GAM1834 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[25552] GAM1834 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1834 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1834 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an

illustration only, and is not meant to be limiting GAM1834 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1834 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[25553] The complementary binding of GAM1834 RNA, herein designated GAM RNA, to target binding sites on GAM1834 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1834 target RNA, herein designated GAM TARGET RNA, into GAM1834 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[25554] It is appreciated that GAM1834 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1834 target genes. The mRNA of each one of this plurality of GAM1834 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1834 RNA, herein designated GAM RNA, and which when bound by GAM1834 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1834 target proteins.

[25555] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition

exerted by GAM1834 gene, herein designated GAM GENE, on one or more GAM1834 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[25556] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1834 correlate with, and may be deduced from, the identity of the target genes which GAM1834 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[25557] Nucleotide sequences of the GAM1834 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1834 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1834 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1834 are further described hereinbelow with reference to Table 1.

[25558] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1834 RNA, herein designated GAM RNA, are described hereinbelow

with reference to Table 2.

[25559] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1835 (GAM1835) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[25560] GAM1835 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1835 was detected is described hereinabove with reference to Figs. 2-8.

[25561] GAM1835 gene, herein designated GAM GENE, and GAM1835 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[25562] GAM1835 gene, herein designated GAM GENE, encodes a GAM1835 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1835 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1835 precursor RNA is designated SEQ ID:1812, and is provided hereinbelow with reference to the sequence listing part.

[25563] GAM1835 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1835 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA

encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[25564] An enzyme complex designated DICER COMPLEX, dices the GAM1835 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1835 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 25%) nucleotide sequence of GAM1835 RNA is designated SEQ ID:4417, and is provided hereinbelow with reference to the sequence listing part.

[25565] GAM1835 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1835 target RNA, herein designated GAM TARGET RNA. GAM1835 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[25566] GAM1835 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1835 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1835 RNA,

herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1835 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1835 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[25567] The complementary binding of GAM1835 RNA, herein designated GAM RNA, to target binding sites on GAM1835 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1835 target RNA, herein designated GAM TARGET RNA, into GAM1835 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[25568] It is appreciated that GAM1835 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1835 target genes. The mRNA of each one of this plurality of GAM1835 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1835 RNA, herein designated GAM RNA, and which when bound by GAM1835 RNA, herein designated GAM RNA,

causes inhibition of translation of respective one or more GAM1835 target proteins.

[25569] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1835 gene, herein designated GAM GENE, on one or more GAM1835 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[25570] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1835 correlate with, and may be deduced from, the identity of the target genes which GAM1835 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[25571] Nucleotide sequences of the GAM1835 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1835 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1835 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1835 are further described hereinbelow with reference to Table 1.

[25572] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1835 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[25573] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1836 (GAM1836) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[25574] GAM1836 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1836 was detected is described hereinabove with reference to Figs. 2-8.

[25575] GAM1836 gene, herein designated GAM GENE, and GAM1836 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[25576] GAM1836 gene, herein designated GAM GENE, encodes a GAM1836 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1836 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1836 precursor RNA is designated SEQ ID:1813, and is provided hereinbelow with reference to the sequence listing part.

[25577] GAM1836 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1836 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[25578] An enzyme complex designated DICER COMPLEX, dices the GAM1836 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1836 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 87%) nucleotide sequence of GAM1836 RNA is designated SEQ ID:4418, and is provided hereinbelow with reference to the sequence listing part.

[25579] GAM1836 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1836 target RNA, herein designated GAM TARGET RNA. GAM1836 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[25580] GAM1836 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1836 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1836 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1836 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1836 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[25581] The complementary binding of GAM1836 RNA, herein designated GAM RNA, to target binding sites on GAM1836 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1836 target RNA, herein designated GAM TARGET RNA, into GAM1836 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[25582] It is appreciated that GAM1836 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1836 target genes. The

mRNA of each one of this plurality of GAM1836 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1836 RNA, herein designated GAM RNA, and which when bound by GAM1836 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1836 target proteins.

[25583] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1836 gene, herein designated GAM GENE, on one or more GAM1836 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[25584] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1836 correlate with, and may be deduced from, the identity of the target genes which GAM1836 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[25585] Nucleotide sequences of the GAM1836 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1836 RNA, herein

designated GAM RNA, and a schematic representation of the secondary folding of GAM1836 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1836 are further described hereinbelow with reference to Table 1.

[25586] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1836 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[25587] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1837 (GAM1837) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[25588] GAM1837 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1837 was detected is described hereinabove with reference to Figs. 2-8.

[25589] GAM1837 gene, herein designated GAM GENE, and GAM1837 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[25590] GAM1837 gene, herein designated GAM GENE, encodes a GAM1837 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1837 precursor RNA,

herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1837 precursor RNA is designated SEQ ID:1814, and is provided hereinbelow with reference to the sequence listing part.

[25591] GAM1837 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1837 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[25592] An enzyme complex designated DICER COMPLEX, dices the GAM1837 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1837 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 87%) nucleotide sequence of GAM1837 RNA is designated SEQ ID:4419, and is provided hereinbelow with reference to the sequence listing part.

[25593] GAM1837 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1837 target RNA, herein designated GAM TARGET RNA. GAM1837 target RNA, herein designated GAM

TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[25594] GAM1837 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1837 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1837 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1837 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1837 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[25595] The complementary binding of GAM1837 RNA, herein designated GAM RNA, to target binding sites on GAM1837 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1837 target RNA, herein designated GAM TARGET RNA, into GAM1837 target protein, herein

designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[25596] It is appreciated that GAM1837 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1837 target genes. The mRNA of each one of this plurality of GAM1837 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1837 RNA, herein designated GAM RNA, and which when bound by GAM1837 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1837 target proteins.

[25597] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1837 gene, herein designated GAM GENE, on one or more GAM1837 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[25598] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1837 correlate with, and may be deduced from, the identity of the target

genes which GAM1837 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[25599] Nucleotide sequences of the GAM1837 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1837 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1837 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1837 are further described hereinbelow with reference to Table 1.

[25600] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1837 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[25601] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1838 (GAM1838) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[25602] GAM1838 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1838 was detected is described hereinabove with reference to Figs. 2-8.

[25603] GAM1838 gene, herein designated GAM GENE, and GAM1838 target gene, herein designated GAM TARGET GENE, are human genes contained in the

human genome.

[25604] GAM1838 gene, herein designated GAM GENE, encodes a GAM1838 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1838 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1838 precursor RNA is designated SEQ ID:1815, and is provided hereinbelow with reference to the sequence listing part.

[25605] GAM1838 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1838 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[25606] An enzyme complex designated DICER COMPLEX, dices the GAM1838 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1838 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 83%) nucleotide sequence of GAM1838 RNA is designated SEQ ID:4420, and is provided

hereinbelow with reference to the sequence listing part.

[25607] GAM1838 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1838 target RNA, herein designated GAM TARGET RNA. GAM1838 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[25608] GAM1838 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1838 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1838 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1838 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1838 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[25609] The complementary binding of GAM1838 RNA, herein designated GAM RNA, to target binding sites on GAM1838 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1838 target RNA, herein designated GAM TARGET RNA, into GAM1838 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[25610] It is appreciated that GAM1838 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1838 target genes. The mRNA of each one of this plurality of GAM1838 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1838 RNA, herein designated GAM RNA, and which when bound by GAM1838 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1838 target proteins.

[25611] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1838 gene, herein designated GAM GENE, on one or more GAM1838 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding

sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[25612] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1838 correlate with, and may be deduced from, the identity of the target genes which GAM1838 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[25613] Nucleotide sequences of the GAM1838 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1838 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1838 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1838 are further described hereinbelow with reference to Table 1.

[25614] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1838 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[25615] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1839 (GAM1839) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[25616] GAM1839 is a novel bioinformatically detected regulatory, non protein

coding, micro RNA (miRNA) gene. The method by which GAM1839 was detected is described hereinabove with reference to Figs. 2-8.

[25617] GAM1839 gene, herein designated GAM GENE, and GAM1839 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[25618] GAM1839 gene, herein designated GAM GENE, encodes a GAM1839 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1839 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1839 precursor RNA is designated SEQ ID:1816, and is provided hereinbelow with reference to the sequence listing part.

[25619] GAM1839 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1839 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[25620] An enzyme complex designated DICER COMPLEX, dices the GAM1839 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1839 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin

structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM1839 RNA is designated SEQ ID:4421, and is provided hereinbelow with reference to the sequence listing part.

[25621] GAM1839 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1839 target RNA, herein designated GAM TARGET RNA. GAM1839 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[25622] GAM1839 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1839 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1839 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1839 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1839 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target

binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[25623] The complementary binding of GAM1839 RNA, herein designated GAM RNA, to target binding sites on GAM1839 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1839 target RNA, herein designated GAM TARGET RNA, into GAM1839 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[25624] It is appreciated that GAM1839 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1839 target genes. The mRNA of each one of this plurality of GAM1839 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1839 RNA, herein designated GAM RNA, and which when bound by GAM1839 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1839 target proteins.

[25625] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1839 gene, herein designated GAM GENE, on one or more GAM1839 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary

binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[25626] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1839 correlate with, and may be deduced from, the identity of the target genes which GAM1839 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[25627] Nucleotide sequences of the GAM1839 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1839 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1839 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1839 are further described hereinbelow with reference to Table 1.

[25628] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1839 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[25629] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1840 (GAM1840) gene, which modulates

expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[25630] GAM1840 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1840 was detected is described hereinabove with reference to Figs. 2-8.

[25631] GAM1840 gene, herein designated GAM GENE, and GAM1840 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[25632] GAM1840 gene, herein designated GAM GENE, encodes a GAM1840 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1840 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1840 precursor RNA is designated SEQ ID:1817, and is provided hereinbelow with reference to the sequence listing part.

[25633] GAM1840 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1840 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[25634] An enzyme complex designated DICER COMPLEX, dices the GAM1840 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1840 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 82%) nucleotide sequence of GAM1840 RNA is designated SEQ ID:4422, and is provided hereinbelow with reference to the sequence listing part.

[25635] GAM1840 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1840 target RNA, herein designated GAM TARGET RNA. GAM1840 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[25636] GAM1840 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1840 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1840 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an

illustration only, and is not meant to be limiting GAM1840 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1840 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[25637] The complementary binding of GAM1840 RNA, herein designated GAM RNA, to target binding sites on GAM1840 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1840 target RNA, herein designated GAM TARGET RNA, into GAM1840 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[25638] It is appreciated that GAM1840 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1840 target genes. The mRNA of each one of this plurality of GAM1840 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1840 RNA, herein designated GAM RNA, and which when bound by GAM1840 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1840 target proteins.

[25639] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition

exerted by GAM1840 gene, herein designated GAM GENE, on one or more GAM1840 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[25640] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1840 correlate with, and may be deduced from, the identity of the target genes which GAM1840 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[25641] Nucleotide sequences of the GAM1840 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1840 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1840 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1840 are further described hereinbelow with reference to Table 1.

[25642] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1840 RNA, herein designated GAM RNA, are described hereinbelow

with reference to Table 2.

[25643] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1841 (GAM1841) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[25644] GAM1841 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1841 was detected is described hereinabove with reference to Figs. 2-8.

[25645] GAM1841 gene, herein designated GAM GENE, and GAM1841 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[25646] GAM1841 gene, herein designated GAM GENE, encodes a GAM1841 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1841 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1841 precursor RNA is designated SEQ ID:1818, and is provided hereinbelow with reference to the sequence listing part.

[25647] GAM1841 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1841 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA

encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[25648] An enzyme complex designated DICER COMPLEX, dices the GAM1841 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1841 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM1841 RNA is designated SEQ ID:4423, and is provided hereinbelow with reference to the sequence listing part.

[25649] GAM1841 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1841 target RNA, herein designated GAM TARGET RNA. GAM1841 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[25650] GAM1841 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1841 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1841 RNA,

herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1841 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1841 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[25651] The complementary binding of GAM1841 RNA, herein designated GAM RNA, to target binding sites on GAM1841 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1841 target RNA, herein designated GAM TARGET RNA, into GAM1841 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[25652] It is appreciated that GAM1841 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1841 target genes. The mRNA of each one of this plurality of GAM1841 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1841 RNA, herein designated GAM RNA, and which when bound by GAM1841 RNA, herein designated GAM RNA,

causes inhibition of translation of respective one or more GAM1841 target proteins.

[25653] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1841 gene, herein designated GAM GENE, on one or more GAM1841 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[25654] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1841 correlate with, and may be deduced from, the identity of the target genes which GAM1841 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[25655] Nucleotide sequences of the GAM1841 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1841 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1841 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1841 are further described hereinbelow with reference to Table 1.

[25656] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1841 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[25657] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1842 (GAM1842) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[25658] GAM1842 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1842 was detected is described hereinabove with reference to Figs. 2-8.

[25659] GAM1842 gene, herein designated GAM GENE, and GAM1842 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[25660] GAM1842 gene, herein designated GAM GENE, encodes a GAM1842 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1842 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1842 precursor RNA is designated SEQ ID:1819, and is provided hereinbelow with reference to the sequence listing part.

[25661] GAM1842 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1842 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[25662] An enzyme complex designated DICER COMPLEX, dices the GAM1842 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1842 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 81%) nucleotide sequence of GAM1842 RNA is designated SEQ ID:4425, and is provided hereinbelow with reference to the sequence listing part.

[25663] GAM1842 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1842 target RNA, herein designated GAM TARGET RNA. GAM1842 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[25664] GAM1842 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1842 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1842 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1842 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1842 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[25665] The complementary binding of GAM1842 RNA, herein designated GAM RNA, to target binding sites on GAM1842 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1842 target RNA, herein designated GAM TARGET RNA, into GAM1842 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[25666] It is appreciated that GAM1842 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1842 target genes. The

mRNA of each one of this plurality of GAM1842 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1842 RNA, herein designated GAM RNA, and which when bound by GAM1842 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1842 target proteins.

[25667] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1842 gene, herein designated GAM GENE, on one or more GAM1842 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[25668] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1842 correlate with, and may be deduced from, the identity of the target genes which GAM1842 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[25669] Nucleotide sequences of the GAM1842 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1842 RNA, herein

designated GAM RNA, and a schematic representation of the secondary folding of GAM1842 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1842 are further described hereinbelow with reference to Table 1.

[25670] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1842 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[25671] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1843 (GAM1843) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[25672] GAM1843 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1843 was detected is described hereinabove with reference to Figs. 2-8.

[25673] GAM1843 gene, herein designated GAM GENE, and GAM1843 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[25674] GAM1843 gene, herein designated GAM GENE, encodes a GAM1843 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1843 precursor RNA,

herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1843 precursor RNA is designated SEQ ID:1820, and is provided hereinbelow with reference to the sequence listing part.

[25675] GAM1843 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1843 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[25676] An enzyme complex designated DICER COMPLEX, dices the GAM1843 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1843 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 94%) nucleotide sequence of GAM1843 RNA is designated SEQ ID:4424, and is provided hereinbelow with reference to the sequence listing part.

[25677] GAM1843 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1843 target RNA, herein designated GAM TARGET RNA. GAM1843 target RNA, herein designated GAM

TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[25678] GAM1843 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1843 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1843 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1843 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1843 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[25679] The complementary binding of GAM1843 RNA, herein designated GAM RNA, to target binding sites on GAM1843 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1843 target RNA, herein designated GAM TARGET RNA, into GAM1843 target protein, herein

designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[25680] It is appreciated that GAM1843 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1843 target genes. The mRNA of each one of this plurality of GAM1843 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1843 RNA, herein designated GAM RNA, and which when bound by GAM1843 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1843 target proteins.

[25681] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1843 gene, herein designated GAM GENE, on one or more GAM1843 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[25682] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1843 correlate with, and may be deduced from, the identity of the target

genes which GAM1843 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[25683] Nucleotide sequences of the GAM1843 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1843 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1843 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1843 are further described hereinbelow with reference to Table 1.

[25684] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1843 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[25685] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1844 (GAM1844) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[25686] GAM1844 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1844 was detected is described hereinabove with reference to Figs. 2-8.

[25687] GAM1844 gene, herein designated GAM GENE, and GAM1844 target gene, herein designated GAM TARGET GENE, are human genes contained in the

human genome.

[25688] GAM1844 gene, herein designated GAM GENE, encodes a GAM1844 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1844 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1844 precursor RNA is designated SEQ ID:1821, and is provided hereinbelow with reference to the sequence listing part.

[25689] GAM1844 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1844 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[25690] An enzyme complex designated DICER COMPLEX, dices the GAM1844 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1844 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 82%) nucleotide sequence of GAM1844 RNA is designated SEQ ID:4426, and is provided

hereinbelow with reference to the sequence listing part.

[25691] GAM1844 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1844 target RNA, herein designated GAM TARGET RNA. GAM1844 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[25692] GAM1844 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1844 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1844 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1844 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1844 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[25693] The complementary binding of GAM1844 RNA, herein designated GAM RNA, to target binding sites on GAM1844 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1844 target RNA, herein designated GAM TARGET RNA, into GAM1844 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[25694] It is appreciated that GAM1844 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1844 target genes. The mRNA of each one of this plurality of GAM1844 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1844 RNA, herein designated GAM RNA, and which when bound by GAM1844 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1844 target proteins.

[25695] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1844 gene, herein designated GAM GENE, on one or more GAM1844 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding

sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[25696] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1844 correlate with, and may be deduced from, the identity of the target genes which GAM1844 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[25697] Nucleotide sequences of the GAM1844 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1844 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1844 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1844 are further described hereinbelow with reference to Table 1.

[25698] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1844 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[25699] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1845 (GAM1845) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[25700] GAM1845 is a novel bioinformatically detected regulatory, non protein

coding, micro RNA (miRNA) gene. The method by which GAM1845 was detected is described hereinabove with reference to Figs. 2-8.

[25701] GAM1845 gene, herein designated GAM GENE, and GAM1845 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[25702] GAM1845 gene, herein designated GAM GENE, encodes a GAM1845 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1845 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1845 precursor RNA is designated SEQ ID:1822, and is provided hereinbelow with reference to the sequence listing part.

[25703] GAM1845 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1845 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[25704] An enzyme complex designated DICER COMPLEX, dices the GAM1845 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1845 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin

structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 82%) nucleotide sequence of GAM1845 RNA is designated SEQ ID:4427, and is provided hereinbelow with reference to the sequence listing part.

[25705] GAM1845 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1845 target RNA, herein designated GAM TARGET RNA. GAM1845 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[25706] GAM1845 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1845 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1845 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1845 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1845 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target

binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[25707] The complementary binding of GAM1845 RNA, herein designated GAM RNA, to target binding sites on GAM1845 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1845 target RNA, herein designated GAM TARGET RNA, into GAM1845 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[25708] It is appreciated that GAM1845 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1845 target genes. The mRNA of each one of this plurality of GAM1845 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1845 RNA, herein designated GAM RNA, and which when bound by GAM1845 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1845 target proteins.

[25709] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1845 gene, herein designated GAM GENE, on one or more GAM1845 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary

binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[25710] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1845 correlate with, and may be deduced from, the identity of the target genes which GAM1845 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[25711] Nucleotide sequences of the GAM1845 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1845 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1845 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1845 are further described hereinbelow with reference to Table 1.

[25712] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1845 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[25713] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1846 (GAM1846) gene, which modulates

expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[25714] GAM1846 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1846 was detected is described hereinabove with reference to Figs. 2-8.

[25715] GAM1846 gene, herein designated GAM GENE, and GAM1846 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[25716] GAM1846 gene, herein designated GAM GENE, encodes a GAM1846 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1846 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1846 precursor RNA is designated SEQ ID:1823, and is provided hereinbelow with reference to the sequence listing part.

[25717] GAM1846 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1846 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[25718] An enzyme complex designated DICER COMPLEX, dices the GAM1846 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1846 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 79%) nucleotide sequence of GAM1846 RNA is designated SEQ ID:4428, and is provided hereinbelow with reference to the sequence listing part.

[25719] GAM1846 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1846 target RNA, herein designated GAM TARGET RNA. GAM1846 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[25720] GAM1846 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1846 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1846 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an

illustration only, and is not meant to be limiting GAM1846 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1846 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[25721] The complementary binding of GAM1846 RNA, herein designated GAM RNA, to target binding sites on GAM1846 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1846 target RNA, herein designated GAM TARGET RNA, into GAM1846 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[25722] It is appreciated that GAM1846 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1846 target genes. The mRNA of each one of this plurality of GAM1846 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1846 RNA, herein designated GAM RNA, and which when bound by GAM1846 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1846 target proteins.

[25723] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition

exerted by GAM1846 gene, herein designated GAM GENE, on one or more GAM1846 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[25724] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1846 correlate with, and may be deduced from, the identity of the target genes which GAM1846 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[25725] Nucleotide sequences of the GAM1846 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1846 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1846 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1846 are further described hereinbelow with reference to Table 1.

[25726] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1846 RNA, herein designated GAM RNA, are described hereinbelow

with reference to Table 2.

[25727] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1847 (GAM1847) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[25728] GAM1847 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1847 was detected is described hereinabove with reference to Figs. 2-8.

[25729] GAM1847 gene, herein designated GAM GENE, and GAM1847 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[25730] GAM1847 gene, herein designated GAM GENE, encodes a GAM1847 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1847 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1847 precursor RNA is designated SEQ ID:1824, and is provided hereinbelow with reference to the sequence listing part.

[25731] GAM1847 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1847 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA

encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[25732] An enzyme complex designated DICER COMPLEX, dices the GAM1847 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1847 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 84%) nucleotide sequence of GAM1847 RNA is designated SEQ ID:4429, and is provided hereinbelow with reference to the sequence listing part.

[25733] GAM1847 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1847 target RNA, herein designated GAM TARGET RNA. GAM1847 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[25734] GAM1847 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1847 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1847 RNA,

herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1847 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1847 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[25735] The complementary binding of GAM1847 RNA, herein designated GAM RNA, to target binding sites on GAM1847 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1847 target RNA, herein designated GAM TARGET RNA, into GAM1847 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[25736] It is appreciated that GAM1847 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1847 target genes. The mRNA of each one of this plurality of GAM1847 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1847 RNA, herein designated GAM RNA, and which when bound by GAM1847 RNA, herein designated GAM RNA,

causes inhibition of translation of respective one or more GAM1847 target proteins.

[25737] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1847 gene, herein designated GAM GENE, on one or more GAM1847 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[25738] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1847 correlate with, and may be deduced from, the identity of the target genes which GAM1847 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[25739] Nucleotide sequences of the GAM1847 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1847 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1847 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1847 are further described hereinbelow with reference to Table 1.

[25740] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1847 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[25741] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1848 (GAM1848) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[25742] GAM1848 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1848 was detected is described hereinabove with reference to Figs. 2-8.

[25743] GAM1848 gene, herein designated GAM GENE, and GAM1848 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[25744] GAM1848 gene, herein designated GAM GENE, encodes a GAM1848 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1848 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1848 precursor RNA is designated SEQ ID:1825, and is provided hereinbelow with reference to the sequence listing part.

[25745] GAM1848 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1848 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[25746] An enzyme complex designated DICER COMPLEX, dices the GAM1848 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1848 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 76%) nucleotide sequence of GAM1848 RNA is designated SEQ ID:4430, and is provided hereinbelow with reference to the sequence listing part.

[25747] GAM1848 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1848 target RNA, herein designated GAM TARGET RNA. GAM1848 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[25748] GAM1848 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1848 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1848 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1848 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1848 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[25749] The complementary binding of GAM1848 RNA, herein designated GAM RNA, to target binding sites on GAM1848 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1848 target RNA, herein designated GAM TARGET RNA, into GAM1848 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[25750] It is appreciated that GAM1848 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1848 target genes. The

mRNA of each one of this plurality of GAM1848 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1848 RNA, herein designated GAM RNA, and which when bound by GAM1848 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1848 target proteins.

[25751] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1848 gene, herein designated GAM GENE, on one or more GAM1848 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[25752] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1848 correlate with, and may be deduced from, the identity of the target genes which GAM1848 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[25753] Nucleotide sequences of the GAM1848 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1848 RNA, herein

designated GAM RNA, and a schematic representation of the secondary folding of GAM1848 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1848 are further described hereinbelow with reference to Table 1.

[25754] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1848 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[25755] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1849 (GAM1849) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[25756] GAM1849 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1849 was detected is described hereinabove with reference to Figs. 2-8.

[25757] GAM1849 gene, herein designated GAM GENE, and GAM1849 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[25758] GAM1849 gene, herein designated GAM GENE, encodes a GAM1849 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1849 precursor RNA,

herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1849 precursor RNA is designated SEQ ID:1826, and is provided hereinbelow with reference to the sequence listing part.

[25759] GAM1849 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1849 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[25760] An enzyme complex designated DICER COMPLEX, dices the GAM1849 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1849 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 81%) nucleotide sequence of GAM1849 RNA is designated SEQ ID:4431, and is provided hereinbelow with reference to the sequence listing part.

[25761] GAM1849 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1849 target RNA, herein designated GAM TARGET RNA. GAM1849 target RNA, herein designated GAM

TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[25762] GAM1849 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1849 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1849 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1849 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1849 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[25763] The complementary binding of GAM1849 RNA, herein designated GAM RNA, to target binding sites on GAM1849 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1849 target RNA, herein designated GAM TARGET RNA, into GAM1849 target protein, herein

designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[25764] It is appreciated that GAM1849 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1849 target genes. The mRNA of each one of this plurality of GAM1849 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1849 RNA, herein designated GAM RNA, and which when bound by GAM1849 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1849 target proteins.

[25765] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1849 gene, herein designated GAM GENE, on one or more GAM1849 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[25766] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1849 correlate with, and may be deduced from, the identity of the target

genes which GAM1849 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[25767] Nucleotide sequences of the GAM1849 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1849 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1849 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1849 are further described hereinbelow with reference to Table 1.

[25768] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1849 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[25769] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1850 (GAM1850) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[25770] GAM1850 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1850 was detected is described hereinabove with reference to Figs. 2-8.

[25771] GAM1850 gene, herein designated GAM GENE, and GAM1850 target gene, herein designated GAM TARGET GENE, are human genes contained in the

human genome.

[25772] GAM1850 gene, herein designated GAM GENE, encodes a GAM1850 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1850 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1850 precursor RNA is designated SEQ ID:1827, and is provided hereinbelow with reference to the sequence listing part.

[25773] GAM1850 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1850 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[25774] An enzyme complex designated DICER COMPLEX, dices the GAM1850 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1850 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 81%) nucleotide sequence of GAM1850 RNA is designated SEQ ID:4432, and is provided

hereinbelow with reference to the sequence listing part.

[25775] GAM1850 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1850 target RNA, herein designated GAM TARGET RNA. GAM1850 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[25776] GAM1850 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1850 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1850 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1850 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1850 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[25777] The complementary binding of GAM1850 RNA, herein designated GAM RNA, to target binding sites on GAM1850 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1850 target RNA, herein designated GAM TARGET RNA, into GAM1850 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[25778] It is appreciated that GAM1850 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1850 target genes. The mRNA of each one of this plurality of GAM1850 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1850 RNA, herein designated GAM RNA, and which when bound by GAM1850 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1850 target proteins.

[25779] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1850 gene, herein designated GAM GENE, on one or more GAM1850 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding

sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[25780] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1850 correlate with, and may be deduced from, the identity of the target genes which GAM1850 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[25781] Nucleotide sequences of the GAM1850 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1850 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1850 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1850 are further described hereinbelow with reference to Table 1.

[25782] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1850 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[25783] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1851 (GAM1851) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[25784] GAM1851 is a novel bioinformatically detected regulatory, non protein

coding, micro RNA (miRNA) gene. The method by which GAM1851 was detected is described hereinabove with reference to Figs. 2-8.

[25785] GAM1851 gene, herein designated GAM GENE, and GAM1851 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[25786] GAM1851 gene, herein designated GAM GENE, encodes a GAM1851 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1851 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1851 precursor RNA is designated SEQ ID:1828, and is provided hereinbelow with reference to the sequence listing part.

[25787] GAM1851 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1851 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[25788] An enzyme complex designated DICER COMPLEX, dices the GAM1851 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1851 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin

structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 87%) nucleotide sequence of GAM1851 RNA is designated SEQ ID:4433, and is provided hereinbelow with reference to the sequence listing part.

[25789] GAM1851 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1851 target RNA, herein designated GAM TARGET RNA. GAM1851 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[25790] GAM1851 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1851 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1851 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1851 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1851 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target

binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[25791] The complementary binding of GAM1851 RNA, herein designated GAM RNA, to target binding sites on GAM1851 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1851 target RNA, herein designated GAM TARGET RNA, into GAM1851 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[25792] It is appreciated that GAM1851 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1851 target genes. The mRNA of each one of this plurality of GAM1851 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1851 RNA, herein designated GAM RNA, and which when bound by GAM1851 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1851 target proteins.

[25793] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1851 gene, herein designated GAM GENE, on one or more GAM1851 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary

binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[25794] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1851 correlate with, and may be deduced from, the identity of the target genes which GAM1851 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[25795] Nucleotide sequences of the GAM1851 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1851 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1851 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1851 are further described hereinbelow with reference to Table 1.

[25796] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1851 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[25797] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1852 (GAM1852) gene, which modulates

expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[25798] GAM1852 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1852 was detected is described hereinabove with reference to Figs. 2-8.

[25799] GAM1852 gene, herein designated GAM GENE, and GAM1852 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[25800] GAM1852 gene, herein designated GAM GENE, encodes a GAM1852 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1852 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1852 precursor RNA is designated SEQ ID:1829, and is provided hereinbelow with reference to the sequence listing part.

[25801] GAM1852 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1852 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[25802] An enzyme complex designated DICER COMPLEX, dices the GAM1852 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1852 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM1852 RNA is designated SEQ ID:4434, and is provided hereinbelow with reference to the sequence listing part.

[25803] GAM1852 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1852 target RNA, herein designated GAM TARGET RNA. GAM1852 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[25804] GAM1852 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1852 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1852 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an

illustration only, and is not meant to be limiting GAM1852 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1852 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[25805] The complementary binding of GAM1852 RNA, herein designated GAM RNA, to target binding sites on GAM1852 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1852 target RNA, herein designated GAM TARGET RNA, into GAM1852 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[25806] It is appreciated that GAM1852 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1852 target genes. The mRNA of each one of this plurality of GAM1852 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1852 RNA, herein designated GAM RNA, and which when bound by GAM1852 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1852 target proteins.

[25807] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition

exerted by GAM1852 gene, herein designated GAM GENE, on one or more GAM1852 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[25808] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1852 correlate with, and may be deduced from, the identity of the target genes which GAM1852 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[25809] Nucleotide sequences of the GAM1852 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1852 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1852 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1852 are further described hereinbelow with reference to Table 1.

[25810] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1852 RNA, herein designated GAM RNA, are described hereinbelow

with reference to Table 2.

[25811] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1853 (GAM1853) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[25812] GAM1853 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1853 was detected is described hereinabove with reference to Figs. 2-8.

[25813] GAM1853 gene, herein designated GAM GENE, and GAM1853 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[25814] GAM1853 gene, herein designated GAM GENE, encodes a GAM1853 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1853 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1853 precursor RNA is designated SEQ ID:1830, and is provided hereinbelow with reference to the sequence listing part.

[25815] GAM1853 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1853 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA

encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[25816] An enzyme complex designated DICER COMPLEX, dices the GAM1853 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1853 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 79%) nucleotide sequence of GAM1853 RNA is designated SEQ ID:4435, and is provided hereinbelow with reference to the sequence listing part.

[25817] GAM1853 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1853 target RNA, herein designated GAM TARGET RNA. GAM1853 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[25818] GAM1853 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1853 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1853 RNA,

herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1853 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1853 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[25819] The complementary binding of GAM1853 RNA, herein designated GAM RNA, to target binding sites on GAM1853 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1853 target RNA, herein designated GAM TARGET RNA, into GAM1853 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[25820] It is appreciated that GAM1853 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1853 target genes. The mRNA of each one of this plurality of GAM1853 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1853 RNA, herein designated GAM RNA, and which when bound by GAM1853 RNA, herein designated GAM RNA,

causes inhibition of translation of respective one or more GAM1853 target proteins.

[25821] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1853 gene, herein designated GAM GENE, on one or more GAM1853 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[25822] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1853 correlate with, and may be deduced from, the identity of the target genes which GAM1853 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[25823] Nucleotide sequences of the GAM1853 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1853 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1853 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1853 are further described hereinbelow with reference to Table 1.

[25824] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1853 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[25825] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1854 (GAM1854) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[25826] GAM1854 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1854 was detected is described hereinabove with reference to Figs. 2-8.

[25827] GAM1854 gene, herein designated GAM GENE, and GAM1854 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[25828] GAM1854 gene, herein designated GAM GENE, encodes a GAM1854 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1854 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1854 precursor RNA is designated SEQ ID:1831, and is provided hereinbelow with reference to the sequence listing part.

[25829] GAM1854 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1854 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[25830] An enzyme complex designated DICER COMPLEX, dices the GAM1854 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1854 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM1854 RNA is designated SEQ ID:4436, and is provided hereinbelow with reference to the sequence listing part.

[25831] GAM1854 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1854 target RNA, herein designated GAM TARGET RNA. GAM1854 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[25832] GAM1854 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1854 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1854 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1854 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1854 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[25833] The complementary binding of GAM1854 RNA, herein designated GAM RNA, to target binding sites on GAM1854 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1854 target RNA, herein designated GAM TARGET RNA, into GAM1854 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[25834] It is appreciated that GAM1854 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1854 target genes. The

mRNA of each one of this plurality of GAM1854 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1854 RNA, herein designated GAM RNA, and which when bound by GAM1854 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1854 target proteins.

[25835] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1854 gene, herein designated GAM GENE, on one or more GAM1854 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[25836] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1854 correlate with, and may be deduced from, the identity of the target genes which GAM1854 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[25837] Nucleotide sequences of the GAM1854 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1854 RNA, herein

designated GAM RNA, and a schematic representation of the secondary folding of GAM1854 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1854 are further described hereinbelow with reference to Table 1.

[25838] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1854 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[25839] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1855 (GAM1855) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[25840] GAM1855 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1855 was detected is described hereinabove with reference to Figs. 2-8.

[25841] GAM1855 gene, herein designated GAM GENE, and GAM1855 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[25842] GAM1855 gene, herein designated GAM GENE, encodes a GAM1855 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1855 precursor RNA,

herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1855 precursor RNA is designated SEQ ID:1832, and is provided hereinbelow with reference to the sequence listing part.

[25843] GAM1855 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1855 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[25844] An enzyme complex designated DICER COMPLEX, dices the GAM1855 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1855 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 78%) nucleotide sequence of GAM1855 RNA is designated SEQ ID:4437, and is provided hereinbelow with reference to the sequence listing part.

[25845] GAM1855 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1855 target RNA, herein designated GAM TARGET RNA. GAM1855 target RNA, herein designated GAM

TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[25846] GAM1855 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1855 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1855 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1855 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1855 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[25847] The complementary binding of GAM1855 RNA, herein designated GAM RNA, to target binding sites on GAM1855 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1855 target RNA, herein designated GAM TARGET RNA, into GAM1855 target protein, herein

designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[25848] It is appreciated that GAM1855 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1855 target genes. The mRNA of each one of this plurality of GAM1855 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1855 RNA, herein designated GAM RNA, and which when bound by GAM1855 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1855 target proteins.

[25849] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1855 gene, herein designated GAM GENE, on one or more GAM1855 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[25850] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1855 correlate with, and may be deduced from, the identity of the target

genes which GAM1855 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[25851] Nucleotide sequences of the GAM1855 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1855 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1855 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1855 are further described hereinbelow with reference to Table 1.

[25852] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1855 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[25853] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1856 (GAM1856) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[25854] GAM1856 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1856 was detected is described hereinabove with reference to Figs. 2-8.

[25855] GAM1856 gene, herein designated GAM GENE, and GAM1856 target gene, herein designated GAM TARGET GENE, are human genes contained in the

human genome.

[25856] GAM1856 gene, herein designated GAM GENE, encodes a GAM1856 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1856 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1856 precursor RNA is designated SEQ ID:1833, and is provided hereinbelow with reference to the sequence listing part.

[25857] GAM1856 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1856 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[25858] An enzyme complex designated DICER COMPLEX, dices the GAM1856 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1856 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 79%) nucleotide sequence of GAM1856 RNA is designated SEQ ID:4438, and is provided

hereinbelow with reference to the sequence listing part.

[25859] GAM1856 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1856 target RNA, herein designated GAM TARGET RNA. GAM1856 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[25860] GAM1856 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1856 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1856 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1856 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1856 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[25861] The complementary binding of GAM1856 RNA, herein designated GAM RNA, to target binding sites on GAM1856 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1856 target RNA, herein designated GAM TARGET RNA, into GAM1856 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[25862] It is appreciated that GAM1856 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1856 target genes. The mRNA of each one of this plurality of GAM1856 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1856 RNA, herein designated GAM RNA, and which when bound by GAM1856 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1856 target proteins.

[25863] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1856 gene, herein designated GAM GENE, on one or more GAM1856 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding

sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[25864] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1856 correlate with, and may be deduced from, the identity of the target genes which GAM1856 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[25865] Nucleotide sequences of the GAM1856 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1856 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1856 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1856 are further described hereinbelow with reference to Table 1.

[25866] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1856 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[25867] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1857 (GAM1857) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[25868] GAM1857 is a novel bioinformatically detected regulatory, non protein

coding, micro RNA (miRNA) gene. The method by which GAM1857 was detected is described hereinabove with reference to Figs. 2-8.

[25869] GAM1857 gene, herein designated GAM GENE, and GAM1857 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[25870] GAM1857 gene, herein designated GAM GENE, encodes a GAM1857 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1857 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1857 precursor RNA is designated SEQ ID:1834, and is provided hereinbelow with reference to the sequence listing part.

[25871] GAM1857 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1857 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[25872] An enzyme complex designated DICER COMPLEX, dices the GAM1857 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1857 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin

structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 86%) nucleotide sequence of GAM1857 RNA is designated SEQ ID:4439, and is provided hereinbelow with reference to the sequence listing part.

[25873] GAM1857 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1857 target RNA, herein designated GAM TARGET RNA. GAM1857 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[25874] GAM1857 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1857 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1857 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1857 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1857 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target

binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[25875] The complementary binding of GAM1857 RNA, herein designated GAM RNA, to target binding sites on GAM1857 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1857 target RNA, herein designated GAM TARGET RNA, into GAM1857 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[25876] It is appreciated that GAM1857 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1857 target genes. The mRNA of each one of this plurality of GAM1857 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1857 RNA, herein designated GAM RNA, and which when bound by GAM1857 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1857 target proteins.

[25877] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1857 gene, herein designated GAM GENE, on one or more GAM1857 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary

binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[25878] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1857 correlate with, and may be deduced from, the identity of the target genes which GAM1857 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[25879] Nucleotide sequences of the GAM1857 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1857 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1857 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1857 are further described hereinbelow with reference to Table 1.

[25880] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1857 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[25881] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1858 (GAM1858) gene, which modulates

expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[25882] GAM1858 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1858 was detected is described hereinabove with reference to Figs. 2-8.

[25883] GAM1858 gene, herein designated GAM GENE, and GAM1858 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[25884] GAM1858 gene, herein designated GAM GENE, encodes a GAM1858 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1858 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1858 precursor RNA is designated SEQ ID:1835, and is provided hereinbelow with reference to the sequence listing part.

[25885] GAM1858 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1858 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[25886] An enzyme complex designated DICER COMPLEX, dices the GAM1858 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1858 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM1858 RNA is designated SEQ ID:4440, and is provided hereinbelow with reference to the sequence listing part.

[25887] GAM1858 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1858 target RNA, herein designated GAM TARGET RNA. GAM1858 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[25888] GAM1858 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1858 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1858 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an

illustration only, and is not meant to be limiting GAM1858 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1858 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[25889] The complementary binding of GAM1858 RNA, herein designated GAM RNA, to target binding sites on GAM1858 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1858 target RNA, herein designated GAM TARGET RNA, into GAM1858 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[25890] It is appreciated that GAM1858 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1858 target genes. The mRNA of each one of this plurality of GAM1858 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1858 RNA, herein designated GAM RNA, and which when bound by GAM1858 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1858 target proteins.

[25891] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition

exerted by GAM1858 gene, herein designated GAM GENE, on one or more GAM1858 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[25892] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1858 correlate with, and may be deduced from, the identity of the target genes which GAM1858 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[25893] Nucleotide sequences of the GAM1858 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1858 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1858 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1858 are further described hereinbelow with reference to Table 1.

[25894] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1858 RNA, herein designated GAM RNA, are described hereinbelow

with reference to Table 2.

[25895] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1859 (GAM1859) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[25896] GAM1859 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1859 was detected is described hereinabove with reference to Figs. 2-8.

[25897] GAM1859 gene, herein designated GAM GENE, and GAM1859 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[25898] GAM1859 gene, herein designated GAM GENE, encodes a GAM1859 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1859 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1859 precursor RNA is designated SEQ ID:1836, and is provided hereinbelow with reference to the sequence listing part.

[25899] GAM1859 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1859 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA

encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[25900] An enzyme complex designated DICER COMPLEX, dices the GAM1859 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1859 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM1859 RNA is designated SEQ ID:4441, and is provided hereinbelow with reference to the sequence listing part.

[25901] GAM1859 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1859 target RNA, herein designated GAM TARGET RNA. GAM1859 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[25902] GAM1859 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1859 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1859 RNA,

herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1859 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1859 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[25903] The complementary binding of GAM1859 RNA, herein designated GAM RNA, to target binding sites on GAM1859 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1859 target RNA, herein designated GAM TARGET RNA, into GAM1859 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[25904] It is appreciated that GAM1859 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1859 target genes. The mRNA of each one of this plurality of GAM1859 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1859 RNA, herein designated GAM RNA, and which when bound by GAM1859 RNA, herein designated GAM RNA,

causes inhibition of translation of respective one or more GAM1859 target proteins.

[25905] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1859 gene, herein designated GAM GENE, on one or more GAM1859 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[25906] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1859 correlate with, and may be deduced from, the identity of the target genes which GAM1859 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[25907] Nucleotide sequences of the GAM1859 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1859 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1859 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1859 are further described hereinbelow with reference to Table 1.

[25908] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1859 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[25909] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1860 (GAM1860) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[25910] GAM1860 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1860 was detected is described hereinabove with reference to Figs. 2-8.

[25911] GAM1860 gene, herein designated GAM GENE, and GAM1860 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[25912] GAM1860 gene, herein designated GAM GENE, encodes a GAM1860 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1860 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1860 precursor RNA is designated SEQ ID:1837, and is provided hereinbelow with reference to the sequence listing part.

[25913] GAM1860 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1860 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[25914] An enzyme complex designated DICER COMPLEX, dices the GAM1860 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1860 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 79%) nucleotide sequence of GAM1860 RNA is designated SEQ ID:4443, and is provided hereinbelow with reference to the sequence listing part.

[25915] GAM1860 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1860 target RNA, herein designated GAM TARGET RNA. GAM1860 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[25916] GAM1860 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1860 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1860 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1860 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1860 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[25917] The complementary binding of GAM1860 RNA, herein designated GAM RNA, to target binding sites on GAM1860 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1860 target RNA, herein designated GAM TARGET RNA, into GAM1860 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[25918] It is appreciated that GAM1860 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1860 target genes. The

mRNA of each one of this plurality of GAM1860 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1860 RNA, herein designated GAM RNA, and which when bound by GAM1860 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1860 target proteins.

[25919] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1860 gene, herein designated GAM GENE, on one or more GAM1860 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[25920] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1860 correlate with, and may be deduced from, the identity of the target genes which GAM1860 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[25921] Nucleotide sequences of the GAM1860 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1860 RNA, herein

designated GAM RNA, and a schematic representation of the secondary folding of GAM1860 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1860 are further described hereinbelow with reference to Table 1.

[25922] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1860 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[25923] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1861 (GAM1861) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[25924] GAM1861 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1861 was detected is described hereinabove with reference to Figs. 2-8.

[25925] GAM1861 gene, herein designated GAM GENE, and GAM1861 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[25926] GAM1861 gene, herein designated GAM GENE, encodes a GAM1861 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1861 precursor RNA,

herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1861 precursor RNA is designated SEQ ID:1838, and is provided hereinbelow with reference to the sequence listing part.

[25927] GAM1861 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1861 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[25928] An enzyme complex designated DICER COMPLEX, dices the GAM1861 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1861 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM1861 RNA is designated SEQ ID:4442, and is provided hereinbelow with reference to the sequence listing part.

[25929] GAM1861 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1861 target RNA, herein designated GAM TARGET RNA. GAM1861 target RNA, herein designated GAM

TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[25930] GAM1861 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1861 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1861 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1861 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1861 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[25931] The complementary binding of GAM1861 RNA, herein designated GAM RNA, to target binding sites on GAM1861 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1861 target RNA, herein designated GAM TARGET RNA, into GAM1861 target protein, herein

designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[25932] It is appreciated that GAM1861 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1861 target genes. The mRNA of each one of this plurality of GAM1861 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1861 RNA, herein designated GAM RNA, and which when bound by GAM1861 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1861 target proteins.

[25933] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1861 gene, herein designated GAM GENE, on one or more GAM1861 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[25934] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1861 correlate with, and may be deduced from, the identity of the target

genes which GAM1861 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[25935] Nucleotide sequences of the GAM1861 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1861 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1861 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1861 are further described hereinbelow with reference to Table 1.

[25936] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1861 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[25937] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1862 (GAM1862) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[25938] GAM1862 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1862 was detected is described hereinabove with reference to Figs. 2-8.

[25939] GAM1862 gene, herein designated GAM GENE, and GAM1862 target gene, herein designated GAM TARGET GENE, are human genes contained in the

human genome.

[25940] GAM1862 gene, herein designated GAM GENE, encodes a GAM1862 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1862 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1862 precursor RNA is designated SEQ ID:1839, and is provided hereinbelow with reference to the sequence listing part.

[25941] GAM1862 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1862 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[25942] An enzyme complex designated DICER COMPLEX, dices the GAM1862 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1862 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 79%) nucleotide sequence of GAM1862 RNA is designated SEQ ID:4444, and is provided

hereinbelow with reference to the sequence listing part.

[25943] GAM1862 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1862 target RNA, herein designated GAM TARGET RNA. GAM1862 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[25944] GAM1862 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1862 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1862 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1862 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1862 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[25945] The complementary binding of GAM1862 RNA, herein designated GAM RNA, to target binding sites on GAM1862 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1862 target RNA, herein designated GAM TARGET RNA, into GAM1862 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[25946] It is appreciated that GAM1862 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1862 target genes. The mRNA of each one of this plurality of GAM1862 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1862 RNA, herein designated GAM RNA, and which when bound by GAM1862 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1862 target proteins.

[25947] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1862 gene, herein designated GAM GENE, on one or more GAM1862 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding

sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[25948] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1862 correlate with, and may be deduced from, the identity of the target genes which GAM1862 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[25949] Nucleotide sequences of the GAM1862 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1862 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1862 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1862 are further described hereinbelow with reference to Table 1.

[25950] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1862 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[25951] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1863 (GAM1863) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[25952] GAM1863 is a novel bioinformatically detected regulatory, non protein

coding, micro RNA (miRNA) gene. The method by which GAM1863 was detected is described hereinabove with reference to Figs. 2-8.

[25953] GAM1863 gene, herein designated GAM GENE, and GAM1863 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[25954] GAM1863 gene, herein designated GAM GENE, encodes a GAM1863 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1863 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1863 precursor RNA is designated SEQ ID:1840, and is provided hereinbelow with reference to the sequence listing part.

[25955] GAM1863 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1863 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[25956] An enzyme complex designated DICER COMPLEX, dices the GAM1863 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1863 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin

structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM1863 RNA is designated SEQ ID:4445, and is provided hereinbelow with reference to the sequence listing part.

[25957] GAM1863 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1863 target RNA, herein designated GAM TARGET RNA. GAM1863 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[25958] GAM1863 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1863 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1863 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1863 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1863 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target

binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[25959] The complementary binding of GAM1863 RNA, herein designated GAM RNA, to target binding sites on GAM1863 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1863 target RNA, herein designated GAM TARGET RNA, into GAM1863 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[25960] It is appreciated that GAM1863 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1863 target genes. The mRNA of each one of this plurality of GAM1863 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1863 RNA, herein designated GAM RNA, and which when bound by GAM1863 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1863 target proteins.

[25961] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1863 gene, herein designated GAM GENE, on one or more GAM1863 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary

binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[25962] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1863 correlate with, and may be deduced from, the identity of the target genes which GAM1863 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[25963] Nucleotide sequences of the GAM1863 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1863 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1863 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1863 are further described hereinbelow with reference to Table 1.

[25964] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1863 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[25965] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1864 (GAM1864) gene, which modulates

expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[25966] GAM1864 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1864 was detected is described hereinabove with reference to Figs. 2-8.

[25967] GAM1864 gene, herein designated GAM GENE, and GAM1864 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[25968] GAM1864 gene, herein designated GAM GENE, encodes a GAM1864 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1864 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1864 precursor RNA is designated SEQ ID:1841, and is provided hereinbelow with reference to the sequence listing part.

[25969] GAM1864 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1864 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[25970] An enzyme complex designated DICER COMPLEX, dices the GAM1864 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1864 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 82%) nucleotide sequence of GAM1864 RNA is designated SEQ ID:4446, and is provided hereinbelow with reference to the sequence listing part.

[25971] GAM1864 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1864 target RNA, herein designated GAM TARGET RNA. GAM1864 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[25972] GAM1864 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1864 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1864 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an

illustration only, and is not meant to be limiting GAM1864 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1864 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[25973] The complementary binding of GAM1864 RNA, herein designated GAM RNA, to target binding sites on GAM1864 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1864 target RNA, herein designated GAM TARGET RNA, into GAM1864 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[25974] It is appreciated that GAM1864 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1864 target genes. The mRNA of each one of this plurality of GAM1864 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1864 RNA, herein designated GAM RNA, and which when bound by GAM1864 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1864 target proteins.

[25975] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition

exerted by GAM1864 gene, herein designated GAM GENE, on one or more GAM1864 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[25976] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1864 correlate with, and may be deduced from, the identity of the target genes which GAM1864 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[25977] Nucleotide sequences of the GAM1864 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1864 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1864 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1864 are further described hereinbelow with reference to Table 1.

[25978] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1864 RNA, herein designated GAM RNA, are described hereinbelow

with reference to Table 2.

[25979] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1865 (GAM1865) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[25980] GAM1865 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1865 was detected is described hereinabove with reference to Figs. 2-8.

[25981] GAM1865 gene, herein designated GAM GENE, and GAM1865 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[25982] GAM1865 gene, herein designated GAM GENE, encodes a GAM1865 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1865 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1865 precursor RNA is designated SEQ ID:1842, and is provided hereinbelow with reference to the sequence listing part.

[25983] GAM1865 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1865 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA

encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[25984] An enzyme complex designated DICER COMPLEX, dices the GAM1865 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1865 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM1865 RNA is designated SEQ ID:4450, and is provided hereinbelow with reference to the sequence listing part.

[25985] GAM1865 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1865 target RNA, herein designated GAM TARGET RNA. GAM1865 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[25986] GAM1865 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1865 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1865 RNA,

herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1865 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1865 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[25987] The complementary binding of GAM1865 RNA, herein designated GAM RNA, to target binding sites on GAM1865 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1865 target RNA, herein designated GAM TARGET RNA, into GAM1865 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[25988] It is appreciated that GAM1865 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1865 target genes. The mRNA of each one of this plurality of GAM1865 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1865 RNA, herein designated GAM RNA, and which when bound by GAM1865 RNA, herein designated GAM RNA,

causes inhibition of translation of respective one or more GAM1865 target proteins.

[25989] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1865 gene, herein designated GAM GENE, on one or more GAM1865 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[25990] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1865 correlate with, and may be deduced from, the identity of the target genes which GAM1865 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[25991] Nucleotide sequences of the GAM1865 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1865 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1865 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1865 are further described hereinbelow with reference to Table 1.

[25992] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1865 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[25993] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1866 (GAM1866) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[25994] GAM1866 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1866 was detected is described hereinabove with reference to Figs. 2-8.

[25995] GAM1866 gene, herein designated GAM GENE, and GAM1866 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[25996] GAM1866 gene, herein designated GAM GENE, encodes a GAM1866 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1866 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1866 precursor RNA is designated SEQ ID:1843, and is provided hereinbelow with reference to the sequence listing part.

[25997] GAM1866 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1866 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[25998] An enzyme complex designated DICER COMPLEX, dices the GAM1866 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1866 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM1866 RNA is designated SEQ ID:4451, and is provided hereinbelow with reference to the sequence listing part.

[25999] GAM1866 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1866 target RNA, herein designated GAM TARGET RNA. GAM1866 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[26000] GAM1866 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1866 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1866 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1866 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1866 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[26001] The complementary binding of GAM1866 RNA, herein designated GAM RNA, to target binding sites on GAM1866 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1866 target RNA, herein designated GAM TARGET RNA, into GAM1866 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[26002] It is appreciated that GAM1866 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1866 target genes. The

mRNA of each one of this plurality of GAM1866 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1866 RNA, herein designated GAM RNA, and which when bound by GAM1866 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1866 target proteins.

[26003] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1866 gene, herein designated GAM GENE, on one or more GAM1866 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[26004] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1866 correlate with, and may be deduced from, the identity of the target genes which GAM1866 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[26005] Nucleotide sequences of the GAM1866 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1866 RNA, herein

designated GAM RNA, and a schematic representation of the secondary folding of GAM1866 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1866 are further described hereinbelow with reference to Table 1.

[26006] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1866 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[26007] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1867 (GAM1867) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[26008] GAM1867 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1867 was detected is described hereinabove with reference to Figs. 2-8.

[26009] GAM1867 gene, herein designated GAM GENE, and GAM1867 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[26010] GAM1867 gene, herein designated GAM GENE, encodes a GAM1867 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1867 precursor RNA,

herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1867 precursor RNA is designated SEQ ID:1844, and is provided hereinbelow with reference to the sequence listing part.

[26011] GAM1867 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1867 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[26012] An enzyme complex designated DICER COMPLEX, dices the GAM1867 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1867 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 85%) nucleotide sequence of GAM1867 RNA is designated SEQ ID:4452, and is provided hereinbelow with reference to the sequence listing part.

[26013] GAM1867 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1867 target RNA, herein designated GAM TARGET RNA. GAM1867 target RNA, herein designated GAM

TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[26014] GAM1867 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1867 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1867 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1867 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1867 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[26015] The complementary binding of GAM1867 RNA, herein designated GAM RNA, to target binding sites on GAM1867 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1867 target RNA, herein designated GAM TARGET RNA, into GAM1867 target protein, herein

designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[26016] It is appreciated that GAM1867 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1867 target genes. The mRNA of each one of this plurality of GAM1867 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1867 RNA, herein designated GAM RNA, and which when bound by GAM1867 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1867 target proteins.

[26017] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1867 gene, herein designated GAM GENE, on one or more GAM1867 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[26018] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1867 correlate with, and may be deduced from, the identity of the target

genes which GAM1867 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[26019] Nucleotide sequences of the GAM1867 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1867 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1867 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1867 are further described hereinbelow with reference to Table 1.

[26020] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1867 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[26021] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1868 (GAM1868) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[26022] GAM1868 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1868 was detected is described hereinabove with reference to Figs. 2-8.

[26023] GAM1868 gene, herein designated GAM GENE, and GAM1868 target gene, herein designated GAM TARGET GENE, are human genes contained in the

human genome.

[26024] GAM1868 gene, herein designated GAM GENE, encodes a GAM1868 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1868 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1868 precursor RNA is designated SEQ ID:1845, and is provided hereinbelow with reference to the sequence listing part.

[26025] GAM1868 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1868 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[26026] An enzyme complex designated DICER COMPLEX, dices the GAM1868 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1868 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 79%) nucleotide sequence of GAM1868 RNA is designated SEQ ID:4453, and is provided

hereinbelow with reference to the sequence listing part.

[26027] GAM1868 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1868 target RNA, herein designated GAM TARGET RNA. GAM1868 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[26028] GAM1868 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1868 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1868 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1868 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1868 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[26029] The complementary binding of GAM1868 RNA, herein designated GAM RNA, to target binding sites on GAM1868 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1868 target RNA, herein designated GAM TARGET RNA, into GAM1868 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[26030] It is appreciated that GAM1868 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1868 target genes. The mRNA of each one of this plurality of GAM1868 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1868 RNA, herein designated GAM RNA, and which when bound by GAM1868 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1868 target proteins.

[26031] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1868 gene, herein designated GAM GENE, on one or more GAM1868 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding

sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[26032] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1868 correlate with, and may be deduced from, the identity of the target genes which GAM1868 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[26033] Nucleotide sequences of the GAM1868 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1868 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1868 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1868 are further described hereinbelow with reference to Table 1.

[26034] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1868 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[26035] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1869 (GAM1869) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[26036] GAM1869 is a novel bioinformatically detected regulatory, non protein

coding, micro RNA (miRNA) gene. The method by which GAM1869 was detected is described hereinabove with reference to Figs. 2-8.

[26037] GAM1869 gene, herein designated GAM GENE, and GAM1869 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[26038] GAM1869 gene, herein designated GAM GENE, encodes a GAM1869 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1869 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1869 precursor RNA is designated SEQ ID:1846, and is provided hereinbelow with reference to the sequence listing part.

[26039] GAM1869 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1869 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[26040] An enzyme complex designated DICER COMPLEX, dices the GAM1869 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1869 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin

structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM1869 RNA is designated SEQ ID:4454, and is provided hereinbelow with reference to the sequence listing part.

[26041] GAM1869 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1869 target RNA, herein designated GAM TARGET RNA. GAM1869 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[26042] GAM1869 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1869 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1869 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1869 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1869 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target

binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[26043] The complementary binding of GAM1869 RNA, herein designated GAM RNA, to target binding sites on GAM1869 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1869 target RNA, herein designated GAM TARGET RNA, into GAM1869 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[26044] It is appreciated that GAM1869 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1869 target genes. The mRNA of each one of this plurality of GAM1869 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1869 RNA, herein designated GAM RNA, and which when bound by GAM1869 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1869 target proteins.

[26045] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1869 gene, herein designated GAM GENE, on one or more GAM1869 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary

binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[26046] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1869 correlate with, and may be deduced from, the identity of the target genes which GAM1869 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[26047] Nucleotide sequences of the GAM1869 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1869 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1869 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1869 are further described hereinbelow with reference to Table 1.

[26048] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1869 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[26049] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1870 (GAM1870) gene, which modulates

expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[26050] GAM1870 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1870 was detected is described hereinabove with reference to Figs. 2-8.

[26051] GAM1870 gene, herein designated GAM GENE, and GAM1870 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[26052] GAM1870 gene, herein designated GAM GENE, encodes a GAM1870 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1870 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1870 precursor RNA is designated SEQ ID:1847, and is provided hereinbelow with reference to the sequence listing part.

[26053] GAM1870 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1870 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[26054] An enzyme complex designated DICER COMPLEX, dices the GAM1870 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1870 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 80%) nucleotide sequence of GAM1870 RNA is designated SEQ ID:4455, and is provided hereinbelow with reference to the sequence listing part.

[26055] GAM1870 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1870 target RNA, herein designated GAM TARGET RNA. GAM1870 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[26056] GAM1870 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1870 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1870 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an

illustration only, and is not meant to be limiting GAM1870 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1870 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[26057] The complementary binding of GAM1870 RNA, herein designated GAM RNA, to target binding sites on GAM1870 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1870 target RNA, herein designated GAM TARGET RNA, into GAM1870 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[26058] It is appreciated that GAM1870 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1870 target genes. The mRNA of each one of this plurality of GAM1870 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1870 RNA, herein designated GAM RNA, and which when bound by GAM1870 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1870 target proteins.

[26059] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition

exerted by GAM1870 gene, herein designated GAM GENE, on one or more GAM1870 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[26060] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1870 correlate with, and may be deduced from, the identity of the target genes which GAM1870 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[26061] Nucleotide sequences of the GAM1870 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1870 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1870 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1870 are further described hereinbelow with reference to Table 1.

[26062] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1870 RNA, herein designated GAM RNA, are described hereinbelow

with reference to Table 2.

[26063] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1871 (GAM1871) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[26064] GAM1871 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1871 was detected is described hereinabove with reference to Figs. 2-8.

[26065] GAM1871 gene, herein designated GAM GENE, and GAM1871 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[26066] GAM1871 gene, herein designated GAM GENE, encodes a GAM1871 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1871 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1871 precursor RNA is designated SEQ ID:1848, and is provided hereinbelow with reference to the sequence listing part.

[26067] GAM1871 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1871 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA

encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[26068] An enzyme complex designated DICER COMPLEX, dices the GAM1871 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1871 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM1871 RNA is designated SEQ ID:4456, and is provided hereinbelow with reference to the sequence listing part.

[26069] GAM1871 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1871 target RNA, herein designated GAM TARGET RNA. GAM1871 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[26070] GAM1871 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1871 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1871 RNA,

herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1871 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1871 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[26071] The complementary binding of GAM1871 RNA, herein designated GAM RNA, to target binding sites on GAM1871 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1871 target RNA, herein designated GAM TARGET RNA, into GAM1871 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[26072] It is appreciated that GAM1871 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1871 target genes. The mRNA of each one of this plurality of GAM1871 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1871 RNA, herein designated GAM RNA, and which when bound by GAM1871 RNA, herein designated GAM RNA,

causes inhibition of translation of respective one or more GAM1871 target proteins.

[26073] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1871 gene, herein designated GAM GENE, on one or more GAM1871 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[26074] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1871 correlate with, and may be deduced from, the identity of the target genes which GAM1871 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[26075] Nucleotide sequences of the GAM1871 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1871 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1871 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1871 are further described hereinbelow with reference to Table 1.

[26076] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1871 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[26077] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1872 (GAM1872) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[26078] GAM1872 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1872 was detected is described hereinabove with reference to Figs. 2-8.

[26079] GAM1872 gene, herein designated GAM GENE, and GAM1872 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[26080] GAM1872 gene, herein designated GAM GENE, encodes a GAM1872 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1872 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1872 precursor RNA is designated SEQ ID:1849, and is provided hereinbelow with reference to the sequence listing part.

[26081] GAM1872 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1872 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[26082] An enzyme complex designated DICER COMPLEX, dices the GAM1872 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1872 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM1872 RNA is designated SEQ ID:4457, and is provided hereinbelow with reference to the sequence listing part.

[26083] GAM1872 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1872 target RNA, herein designated GAM TARGET RNA. GAM1872 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[26084] GAM1872 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1872 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1872 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1872 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1872 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[26085] The complementary binding of GAM1872 RNA, herein designated GAM RNA, to target binding sites on GAM1872 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1872 target RNA, herein designated GAM TARGET RNA, into GAM1872 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[26086] It is appreciated that GAM1872 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1872 target genes. The

mRNA of each one of this plurality of GAM1872 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1872 RNA, herein designated GAM RNA, and which when bound by GAM1872 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1872 target proteins.

[26087] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1872 gene, herein designated GAM GENE, on one or more GAM1872 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[26088] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1872 correlate with, and may be deduced from, the identity of the target genes which GAM1872 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[26089] Nucleotide sequences of the GAM1872 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1872 RNA, herein

designated GAM RNA, and a schematic representation of the secondary folding of GAM1872 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1872 are further described hereinbelow with reference to Table 1.

[26090] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1872 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[26091] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1873 (GAM1873) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[26092] GAM1873 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1873 was detected is described hereinabove with reference to Figs. 2-8.

[26093] GAM1873 gene, herein designated GAM GENE, and GAM1873 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[26094] GAM1873 gene, herein designated GAM GENE, encodes a GAM1873 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1873 precursor RNA,

herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1873 precursor RNA is designated SEQ ID:1850, and is provided hereinbelow with reference to the sequence listing part.

[26095] GAM1873 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1873 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[26096] An enzyme complex designated DICER COMPLEX, dices the GAM1873 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1873 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM1873 RNA is designated SEQ ID:4458, and is provided hereinbelow with reference to the sequence listing part.

[26097] GAM1873 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1873 target RNA, herein designated GAM TARGET RNA. GAM1873 target RNA, herein designated GAM

TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[26098] GAM1873 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1873 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1873 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1873 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1873 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[26099] The complementary binding of GAM1873 RNA, herein designated GAM RNA, to target binding sites on GAM1873 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1873 target RNA, herein designated GAM TARGET RNA, into GAM1873 target protein, herein

designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[26100] It is appreciated that GAM1873 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1873 target genes. The mRNA of each one of this plurality of GAM1873 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1873 RNA, herein designated GAM RNA, and which when bound by GAM1873 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1873 target proteins.

[26101] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1873 gene, herein designated GAM GENE, on one or more GAM1873 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[26102] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1873 correlate with, and may be deduced from, the identity of the target

genes which GAM1873 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[26103] Nucleotide sequences of the GAM1873 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1873 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1873 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1873 are further described hereinbelow with reference to Table 1.

[26104] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1873 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[26105] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1874 (GAM1874) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[26106] GAM1874 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1874 was detected is described hereinabove with reference to Figs. 2-8.

[26107] GAM1874 gene, herein designated GAM GENE, and GAM1874 target gene, herein designated GAM TARGET GENE, are human genes contained in the

human genome.

[26108] GAM1874 gene, herein designated GAM GENE, encodes a GAM1874 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1874 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1874 precursor RNA is designated SEQ ID:1851, and is provided hereinbelow with reference to the sequence listing part.

[26109] GAM1874 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1874 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[26110] An enzyme complex designated DICER COMPLEX, dices the GAM1874 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1874 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 82%) nucleotide sequence of GAM1874 RNA is designated SEQ ID:4459, and is provided

hereinbelow with reference to the sequence listing part.

[26111] GAM1874 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1874 target RNA, herein designated GAM TARGET RNA. GAM1874 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[26112] GAM1874 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1874 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1874 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1874 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1874 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[26113] The complementary binding of GAM1874 RNA, herein designated GAM RNA, to target binding sites on GAM1874 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1874 target RNA, herein designated GAM TARGET RNA, into GAM1874 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[26114] It is appreciated that GAM1874 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1874 target genes. The mRNA of each one of this plurality of GAM1874 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1874 RNA, herein designated GAM RNA, and which when bound by GAM1874 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1874 target proteins.

[26115] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1874 gene, herein designated GAM GENE, on one or more GAM1874 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding

sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[26116] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1874 correlate with, and may be deduced from, the identity of the target genes which GAM1874 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[26117] Nucleotide sequences of the GAM1874 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1874 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1874 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1874 are further described hereinbelow with reference to Table 1.

[26118] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1874 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[26119] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1875 (GAM1875) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[26120] GAM1875 is a novel bioinformatically detected regulatory, non protein

coding, micro RNA (miRNA) gene. The method by which GAM1875 was detected is described hereinabove with reference to Figs. 2-8.

[26121] GAM1875 gene, herein designated GAM GENE, and GAM1875 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[26122] GAM1875 gene, herein designated GAM GENE, encodes a GAM1875 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1875 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1875 precursor RNA is designated SEQ ID:1852, and is provided hereinbelow with reference to the sequence listing part.

[26123] GAM1875 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1875 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[26124] An enzyme complex designated DICER COMPLEX, dices the GAM1875 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1875 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin

structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM1875 RNA is designated SEQ ID:4461, and is provided hereinbelow with reference to the sequence listing part.

[26125] GAM1875 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1875 target RNA, herein designated GAM TARGET RNA. GAM1875 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[26126] GAM1875 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1875 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1875 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1875 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1875 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target

binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[26127] The complementary binding of GAM1875 RNA, herein designated GAM RNA, to target binding sites on GAM1875 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1875 target RNA, herein designated GAM TARGET RNA, into GAM1875 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[26128] It is appreciated that GAM1875 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1875 target genes. The mRNA of each one of this plurality of GAM1875 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1875 RNA, herein designated GAM RNA, and which when bound by GAM1875 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1875 target proteins.

[26129] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1875 gene, herein designated GAM GENE, on one or more GAM1875 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary

binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[26130] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1875 correlate with, and may be deduced from, the identity of the target genes which GAM1875 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[26131] Nucleotide sequences of the GAM1875 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1875 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1875 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1875 are further described hereinbelow with reference to Table 1.

[26132] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1875 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[26133] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1876 (GAM1876) gene, which modulates

expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[26134] GAM1876 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1876 was detected is described hereinabove with reference to Figs. 2-8.

[26135] GAM1876 gene, herein designated GAM GENE, and GAM1876 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[26136] GAM1876 gene, herein designated GAM GENE, encodes a GAM1876 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1876 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1876 precursor RNA is designated SEQ ID:1853, and is provided hereinbelow with reference to the sequence listing part.

[26137] GAM1876 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1876 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[26138] An enzyme complex designated DICER COMPLEX, dices the GAM1876 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1876 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM1876 RNA is designated SEQ ID:4460, and is provided hereinbelow with reference to the sequence listing part.

[26139] GAM1876 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1876 target RNA, herein designated GAM TARGET RNA. GAM1876 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[26140] GAM1876 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1876 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1876 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an

illustration only, and is not meant to be limiting GAM1876 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1876 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[26141] The complementary binding of GAM1876 RNA, herein designated GAM RNA, to target binding sites on GAM1876 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1876 target RNA, herein designated GAM TARGET RNA, into GAM1876 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[26142] It is appreciated that GAM1876 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1876 target genes. The mRNA of each one of this plurality of GAM1876 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1876 RNA, herein designated GAM RNA, and which when bound by GAM1876 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1876 target proteins.

[26143] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition

exerted by GAM1876 gene, herein designated GAM GENE, on one or more GAM1876 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[26144] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1876 correlate with, and may be deduced from, the identity of the target genes which GAM1876 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[26145] Nucleotide sequences of the GAM1876 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1876 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1876 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1876 are further described hereinbelow with reference to Table 1.

[26146] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1876 RNA, herein designated GAM RNA, are described hereinbelow

with reference to Table 2.

[26147] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1877 (GAM1877) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[26148] GAM1877 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1877 was detected is described hereinabove with reference to Figs. 2-8.

[26149] GAM1877 gene, herein designated GAM GENE, and GAM1877 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[26150] GAM1877 gene, herein designated GAM GENE, encodes a GAM1877 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1877 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1877 precursor RNA is designated SEQ ID:1854, and is provided hereinbelow with reference to the sequence listing part.

[26151] GAM1877 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1877 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA

encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[26152] An enzyme complex designated DICER COMPLEX, dices the GAM1877 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1877 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM1877 RNA is designated SEQ ID:4462, and is provided hereinbelow with reference to the sequence listing part.

[26153] GAM1877 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1877 target RNA, herein designated GAM TARGET RNA. GAM1877 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[26154] GAM1877 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1877 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1877 RNA,

herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1877 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1877 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[26155] The complementary binding of GAM1877 RNA, herein designated GAM RNA, to target binding sites on GAM1877 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1877 target RNA, herein designated GAM TARGET RNA, into GAM1877 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[26156] It is appreciated that GAM1877 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1877 target genes. The mRNA of each one of this plurality of GAM1877 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1877 RNA, herein designated GAM RNA, and which when bound by GAM1877 RNA, herein designated GAM RNA,

causes inhibition of translation of respective one or more GAM1877 target proteins.

[26157] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1877 gene, herein designated GAM GENE, on one or more GAM1877 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[26158] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1877 correlate with, and may be deduced from, the identity of the target genes which GAM1877 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[26159] Nucleotide sequences of the GAM1877 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1877 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1877 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1877 are further described hereinbelow with reference to Table 1.

[26160] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1877 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[26161] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1878 (GAM1878) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[26162] GAM1878 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1878 was detected is described hereinabove with reference to Figs. 2-8.

[26163] GAM1878 gene, herein designated GAM GENE, and GAM1878 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[26164] GAM1878 gene, herein designated GAM GENE, encodes a GAM1878 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1878 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1878 precursor RNA is designated SEQ ID:1855, and is provided hereinbelow with reference to the sequence listing part.

[26165] GAM1878 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1878 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[26166] An enzyme complex designated DICER COMPLEX, dices the GAM1878 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1878 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 87%) nucleotide sequence of GAM1878 RNA is designated SEQ ID:4463, and is provided hereinbelow with reference to the sequence listing part.

[26167] GAM1878 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1878 target RNA, herein designated GAM TARGET RNA. GAM1878 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[26168] GAM1878 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1878 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1878 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1878 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1878 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[26169] The complementary binding of GAM1878 RNA, herein designated GAM RNA, to target binding sites on GAM1878 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1878 target RNA, herein designated GAM TARGET RNA, into GAM1878 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[26170] It is appreciated that GAM1878 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1878 target genes. The

mRNA of each one of this plurality of GAM1878 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1878 RNA, herein designated GAM RNA, and which when bound by GAM1878 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1878 target proteins.

[26171] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1878 gene, herein designated GAM GENE, on one or more GAM1878 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[26172] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1878 correlate with, and may be deduced from, the identity of the target genes which GAM1878 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[26173] Nucleotide sequences of the GAM1878 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1878 RNA, herein

designated GAM RNA, and a schematic representation of the secondary folding of GAM1878 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1878 are further described hereinbelow with reference to Table 1.

[26174] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1878 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[26175] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1879 (GAM1879) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[26176] GAM1879 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1879 was detected is described hereinabove with reference to Figs. 2-8.

[26177] GAM1879 gene, herein designated GAM GENE, and GAM1879 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[26178] GAM1879 gene, herein designated GAM GENE, encodes a GAM1879 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1879 precursor RNA,

herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1879 precursor RNA is designated SEQ ID:1856, and is provided hereinbelow with reference to the sequence listing part.

[26179] GAM1879 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1879 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[26180] An enzyme complex designated DICER COMPLEX, dices the GAM1879 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1879 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM1879 RNA is designated SEQ ID:4464, and is provided hereinbelow with reference to the sequence listing part.

[26181] GAM1879 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1879 target RNA, herein designated GAM TARGET RNA. GAM1879 target RNA, herein designated GAM

TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[26182] GAM1879 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1879 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1879 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1879 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1879 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[26183] The complementary binding of GAM1879 RNA, herein designated GAM RNA, to target binding sites on GAM1879 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1879 target RNA, herein designated GAM TARGET RNA, into GAM1879 target protein, herein

designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[26184] It is appreciated that GAM1879 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1879 target genes. The mRNA of each one of this plurality of GAM1879 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1879 RNA, herein designated GAM RNA, and which when bound by GAM1879 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1879 target proteins.

[26185] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1879 gene, herein designated GAM GENE, on one or more GAM1879 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[26186] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1879 correlate with, and may be deduced from, the identity of the target

genes which GAM1879 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[26187] Nucleotide sequences of the GAM1879 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1879 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1879 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1879 are further described hereinbelow with reference to Table 1.

[26188] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1879 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[26189] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1880 (GAM1880) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[26190] GAM1880 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1880 was detected is described hereinabove with reference to Figs. 2-8.

[26191] GAM1880 gene, herein designated GAM GENE, and GAM1880 target gene, herein designated GAM TARGET GENE, are human genes contained in the

human genome.

[26192] GAM1880 gene, herein designated GAM GENE, encodes a GAM1880 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1880 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1880 precursor RNA is designated SEQ ID:1857, and is provided hereinbelow with reference to the sequence listing part.

[26193] GAM1880 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1880 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[26194] An enzyme complex designated DICER COMPLEX, dices the GAM1880 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1880 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 84%) nucleotide sequence of GAM1880 RNA is designated SEQ ID:4465, and is provided

hereinbelow with reference to the sequence listing part.

[26195] GAM1880 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1880 target RNA, herein designated GAM TARGET RNA. GAM1880 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[26196] GAM1880 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1880 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1880 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1880 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1880 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[26197] The complementary binding of GAM1880 RNA, herein designated GAM RNA, to target binding sites on GAM1880 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1880 target RNA, herein designated GAM TARGET RNA, into GAM1880 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[26198] It is appreciated that GAM1880 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1880 target genes. The mRNA of each one of this plurality of GAM1880 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1880 RNA, herein designated GAM RNA, and which when bound by GAM1880 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1880 target proteins.

[26199] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1880 gene, herein designated GAM GENE, on one or more GAM1880 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding

sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[26200] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1880 correlate with, and may be deduced from, the identity of the target genes which GAM1880 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[26201] Nucleotide sequences of the GAM1880 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1880 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1880 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1880 are further described hereinbelow with reference to Table 1.

[26202] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1880 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[26203] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1881 (GAM1881) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[26204] GAM1881 is a novel bioinformatically detected regulatory, non protein

coding, micro RNA (miRNA) gene. The method by which GAM1881 was detected is described hereinabove with reference to Figs. 2-8.

[26205] GAM1881 gene, herein designated GAM GENE, and GAM1881 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[26206] GAM1881 gene, herein designated GAM GENE, encodes a GAM1881 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1881 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1881 precursor RNA is designated SEQ ID:1858, and is provided hereinbelow with reference to the sequence listing part.

[26207] GAM1881 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1881 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[26208] An enzyme complex designated DICER COMPLEX, dices the GAM1881 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1881 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin

structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 83%) nucleotide sequence of GAM1881 RNA is designated SEQ ID:4466, and is provided hereinbelow with reference to the sequence listing part.

[26209] GAM1881 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1881 target RNA, herein designated GAM TARGET RNA. GAM1881 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[26210] GAM1881 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1881 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1881 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1881 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1881 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target

binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[26211] The complementary binding of GAM1881 RNA, herein designated GAM RNA, to target binding sites on GAM1881 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1881 target RNA, herein designated GAM TARGET RNA, into GAM1881 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[26212] It is appreciated that GAM1881 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1881 target genes. The mRNA of each one of this plurality of GAM1881 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1881 RNA, herein designated GAM RNA, and which when bound by GAM1881 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1881 target proteins.

[26213] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1881 gene, herein designated GAM GENE, on one or more GAM1881 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary

binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[26214] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1881 correlate with, and may be deduced from, the identity of the target genes which GAM1881 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[26215] Nucleotide sequences of the GAM1881 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1881 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1881 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1881 are further described hereinbelow with reference to Table 1.

[26216] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1881 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[26217] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1882 (GAM1882) gene, which modulates

expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[26218] GAM1882 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1882 was detected is described hereinabove with reference to Figs. 2-8.

[26219] GAM1882 gene, herein designated GAM GENE, and GAM1882 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[26220] GAM1882 gene, herein designated GAM GENE, encodes a GAM1882 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1882 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1882 precursor RNA is designated SEQ ID:1859, and is provided hereinbelow with reference to the sequence listing part.

[26221] GAM1882 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1882 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[26222] An enzyme complex designated DICER COMPLEX, dices the GAM1882 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1882 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 89%) nucleotide sequence of GAM1882 RNA is designated SEQ ID:4467, and is provided hereinbelow with reference to the sequence listing part.

[26223] GAM1882 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1882 target RNA, herein designated GAM TARGET RNA. GAM1882 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[26224] GAM1882 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1882 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1882 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an

illustration only, and is not meant to be limiting GAM1882 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1882 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[26225] The complementary binding of GAM1882 RNA, herein designated GAM RNA, to target binding sites on GAM1882 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1882 target RNA, herein designated GAM TARGET RNA, into GAM1882 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[26226] It is appreciated that GAM1882 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1882 target genes. The mRNA of each one of this plurality of GAM1882 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1882 RNA, herein designated GAM RNA, and which when bound by GAM1882 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1882 target proteins.

[26227] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition

exerted by GAM1882 gene, herein designated GAM GENE, on one or more GAM1882 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[26228] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1882 correlate with, and may be deduced from, the identity of the target genes which GAM1882 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[26229] Nucleotide sequences of the GAM1882 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1882 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1882 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1882 are further described hereinbelow with reference to Table 1.

[26230] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1882 RNA, herein designated GAM RNA, are described hereinbelow

with reference to Table 2.

[26231] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1883 (GAM1883) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[26232] GAM1883 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1883 was detected is described hereinabove with reference to Figs. 2-8.

[26233] GAM1883 gene, herein designated GAM GENE, and GAM1883 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[26234] GAM1883 gene, herein designated GAM GENE, encodes a GAM1883 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1883 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1883 precursor RNA is designated SEQ ID:1860, and is provided hereinbelow with reference to the sequence listing part.

[26235] GAM1883 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1883 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA

encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[26236] An enzyme complex designated DICER COMPLEX, dices the GAM1883 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1883 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM1883 RNA is designated SEQ ID:4468, and is provided hereinbelow with reference to the sequence listing part.

[26237] GAM1883 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1883 target RNA, herein designated GAM TARGET RNA. GAM1883 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[26238] GAM1883 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1883 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1883 RNA,

herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1883 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1883 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[26239] The complementary binding of GAM1883 RNA, herein designated GAM RNA, to target binding sites on GAM1883 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1883 target RNA, herein designated GAM TARGET RNA, into GAM1883 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[26240] It is appreciated that GAM1883 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1883 target genes. The mRNA of each one of this plurality of GAM1883 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1883 RNA, herein designated GAM RNA, and which when bound by GAM1883 RNA, herein designated GAM RNA,

causes inhibition of translation of respective one or more GAM1883 target proteins.

[26241] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1883 gene, herein designated GAM GENE, on one or more GAM1883 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[26242] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1883 correlate with, and may be deduced from, the identity of the target genes which GAM1883 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[26243] Nucleotide sequences of the GAM1883 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1883 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1883 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1883 are further described hereinbelow with reference to Table 1.

[26244] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1883 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[26245] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1884 (GAM1884) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[26246] GAM1884 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1884 was detected is described hereinabove with reference to Figs. 2-8.

[26247] GAM1884 gene, herein designated GAM GENE, and GAM1884 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[26248] GAM1884 gene, herein designated GAM GENE, encodes a GAM1884 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1884 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1884 precursor RNA is designated SEQ ID:1861, and is provided hereinbelow with reference to the sequence listing part.

[26249] GAM1884 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1884 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[26250] An enzyme complex designated DICER COMPLEX, dices the GAM1884 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1884 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 81%) nucleotide sequence of GAM1884 RNA is designated SEQ ID:4469, and is provided hereinbelow with reference to the sequence listing part.

[26251] GAM1884 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1884 target RNA, herein designated GAM TARGET RNA. GAM1884 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[26252] GAM1884 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1884 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1884 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1884 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1884 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[26253] The complementary binding of GAM1884 RNA, herein designated GAM RNA, to target binding sites on GAM1884 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1884 target RNA, herein designated GAM TARGET RNA, into GAM1884 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[26254] It is appreciated that GAM1884 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1884 target genes. The

mRNA of each one of this plurality of GAM1884 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1884 RNA, herein designated GAM RNA, and which when bound by GAM1884 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1884 target proteins.

[26255] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1884 gene, herein designated GAM GENE, on one or more GAM1884 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[26256] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1884 correlate with, and may be deduced from, the identity of the target genes which GAM1884 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[26257] Nucleotide sequences of the GAM1884 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1884 RNA, herein

designated GAM RNA, and a schematic representation of the secondary folding of GAM1884 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1884 are further described hereinbelow with reference to Table 1.

[26258] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1884 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[26259] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1885 (GAM1885) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[26260] GAM1885 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1885 was detected is described hereinabove with reference to Figs. 2-8.

[26261] GAM1885 gene, herein designated GAM GENE, and GAM1885 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[26262] GAM1885 gene, herein designated GAM GENE, encodes a GAM1885 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1885 precursor RNA,

herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1885 precursor RNA is designated SEQ ID:1862, and is provided hereinbelow with reference to the sequence listing part.

[26263] GAM1885 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1885 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[26264] An enzyme complex designated DICER COMPLEX, dices the GAM1885 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1885 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 84%) nucleotide sequence of GAM1885 RNA is designated SEQ ID:4470, and is provided hereinbelow with reference to the sequence listing part.

[26265] GAM1885 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1885 target RNA, herein designated GAM TARGET RNA. GAM1885 target RNA, herein designated GAM

TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[26266] GAM1885 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1885 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1885 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1885 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1885 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[26267] The complementary binding of GAM1885 RNA, herein designated GAM RNA, to target binding sites on GAM1885 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1885 target RNA, herein designated GAM TARGET RNA, into GAM1885 target protein, herein

designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[26268] It is appreciated that GAM1885 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1885 target genes. The mRNA of each one of this plurality of GAM1885 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1885 RNA, herein designated GAM RNA, and which when bound by GAM1885 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1885 target proteins.

[26269] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1885 gene, herein designated GAM GENE, on one or more GAM1885 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[26270] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1885 correlate with, and may be deduced from, the identity of the target

genes which GAM1885 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[26271] Nucleotide sequences of the GAM1885 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1885 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1885 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1885 are further described hereinbelow with reference to Table 1.

[26272] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1885 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[26273] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1886 (GAM1886) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[26274] GAM1886 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1886 was detected is described hereinabove with reference to Figs. 2-8.

[26275] GAM1886 gene, herein designated GAM GENE, and GAM1886 target gene, herein designated GAM TARGET GENE, are human genes contained in the

human genome.

[26276] GAM1886 gene, herein designated GAM GENE, encodes a GAM1886 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1886 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1886 precursor RNA is designated SEQ ID:1863, and is provided hereinbelow with reference to the sequence listing part.

[26277] GAM1886 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1886 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[26278] An enzyme complex designated DICER COMPLEX, dices the GAM1886 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1886 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 88%) nucleotide sequence of GAM1886 RNA is designated SEQ ID:4471, and is provided

hereinbelow with reference to the sequence listing part.

[26279] GAM1886 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1886 target RNA, herein designated GAM TARGET RNA. GAM1886 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[26280] GAM1886 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1886 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1886 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1886 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1886 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[26281] The complementary binding of GAM1886 RNA, herein designated GAM RNA, to target binding sites on GAM1886 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1886 target RNA, herein designated GAM TARGET RNA, into GAM1886 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[26282] It is appreciated that GAM1886 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1886 target genes. The mRNA of each one of this plurality of GAM1886 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1886 RNA, herein designated GAM RNA, and which when bound by GAM1886 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1886 target proteins.

[26283] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1886 gene, herein designated GAM GENE, on one or more GAM1886 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding

sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[26284] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1886 correlate with, and may be deduced from, the identity of the target genes which GAM1886 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[26285] Nucleotide sequences of the GAM1886 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1886 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1886 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1886 are further described hereinbelow with reference to Table 1.

[26286] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1886 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[26287] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1887 (GAM1887) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[26288] GAM1887 is a novel bioinformatically detected regulatory, non protein

coding, micro RNA (miRNA) gene. The method by which GAM1887 was detected is described hereinabove with reference to Figs. 2-8.

[26289] GAM1887 gene, herein designated GAM GENE, and GAM1887 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[26290] GAM1887 gene, herein designated GAM GENE, encodes a GAM1887 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1887 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1887 precursor RNA is designated SEQ ID:1864, and is provided hereinbelow with reference to the sequence listing part.

[26291] GAM1887 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1887 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[26292] An enzyme complex designated DICER COMPLEX, dices the GAM1887 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1887 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin

structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 93%) nucleotide sequence of GAM1887 RNA is designated SEQ ID:4473, and is provided hereinbelow with reference to the sequence listing part.

[26293] GAM1887 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1887 target RNA, herein designated GAM TARGET RNA. GAM1887 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[26294] GAM1887 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1887 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1887 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1887 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1887 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target

binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[26295] The complementary binding of GAM1887 RNA, herein designated GAM RNA, to target binding sites on GAM1887 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1887 target RNA, herein designated GAM TARGET RNA, into GAM1887 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[26296] It is appreciated that GAM1887 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1887 target genes. The mRNA of each one of this plurality of GAM1887 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1887 RNA, herein designated GAM RNA, and which when bound by GAM1887 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1887 target proteins.

[26297] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1887 gene, herein designated GAM GENE, on one or more GAM1887 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary

binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[26298] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1887 correlate with, and may be deduced from, the identity of the target genes which GAM1887 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[26299] Nucleotide sequences of the GAM1887 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1887 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1887 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1887 are further described hereinbelow with reference to Table 1.

[26300] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1887 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[26301] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1888 (GAM1888) gene, which modulates

expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[26302] GAM1888 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1888 was detected is described hereinabove with reference to Figs. 2-8.

[26303] GAM1888 gene, herein designated GAM GENE, and GAM1888 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[26304] GAM1888 gene, herein designated GAM GENE, encodes a GAM1888 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1888 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1888 precursor RNA is designated SEQ ID:1865, and is provided hereinbelow with reference to the sequence listing part.

[26305] GAM1888 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1888 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[26306] An enzyme complex designated DICER COMPLEX, dices the GAM1888 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1888 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 86%) nucleotide sequence of GAM1888 RNA is designated SEQ ID:4472, and is provided hereinbelow with reference to the sequence listing part.

[26307] GAM1888 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1888 target RNA, herein designated GAM TARGET RNA. GAM1888 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[26308] GAM1888 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1888 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1888 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an

illustration only, and is not meant to be limiting GAM1888 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1888 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[26309] The complementary binding of GAM1888 RNA, herein designated GAM RNA, to target binding sites on GAM1888 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1888 target RNA, herein designated GAM TARGET RNA, into GAM1888 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[26310] It is appreciated that GAM1888 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1888 target genes. The mRNA of each one of this plurality of GAM1888 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1888 RNA, herein designated GAM RNA, and which when bound by GAM1888 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1888 target proteins.

[26311] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition

exerted by GAM1888 gene, herein designated GAM GENE, on one or more GAM1888 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[26312] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1888 correlate with, and may be deduced from, the identity of the target genes which GAM1888 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[26313] Nucleotide sequences of the GAM1888 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1888 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1888 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1888 are further described hereinbelow with reference to Table 1.

[26314] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1888 RNA, herein designated GAM RNA, are described hereinbelow

with reference to Table 2.

[26315] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1889 (GAM1889) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[26316] GAM1889 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1889 was detected is described hereinabove with reference to Figs. 2-8.

[26317] GAM1889 gene, herein designated GAM GENE, and GAM1889 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[26318] GAM1889 gene, herein designated GAM GENE, encodes a GAM1889 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1889 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1889 precursor RNA is designated SEQ ID:1866, and is provided hereinbelow with reference to the sequence listing part.

[26319] GAM1889 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1889 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA

encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[26320] An enzyme complex designated DICER COMPLEX, dices the GAM1889 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1889 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM1889 RNA is designated SEQ ID:4474, and is provided hereinbelow with reference to the sequence listing part.

[26321] GAM1889 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1889 target RNA, herein designated GAM TARGET RNA. GAM1889 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[26322] GAM1889 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1889 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1889 RNA,

herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1889 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1889 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[26323] The complementary binding of GAM1889 RNA, herein designated GAM RNA, to target binding sites on GAM1889 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1889 target RNA, herein designated GAM TARGET RNA, into GAM1889 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[26324] It is appreciated that GAM1889 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1889 target genes. The mRNA of each one of this plurality of GAM1889 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1889 RNA, herein designated GAM RNA, and which when bound by GAM1889 RNA, herein designated GAM RNA,

causes inhibition of translation of respective one or more GAM1889 target proteins.

[26325] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1889 gene, herein designated GAM GENE, on one or more GAM1889 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[26326] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1889 correlate with, and may be deduced from, the identity of the target genes which GAM1889 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[26327] Nucleotide sequences of the GAM1889 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1889 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1889 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1889 are further described hereinbelow with reference to Table 1.

[26328] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1889 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[26329] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1890 (GAM1890) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[26330] GAM1890 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1890 was detected is described hereinabove with reference to Figs. 2-8.

[26331] GAM1890 gene, herein designated GAM GENE, and GAM1890 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[26332] GAM1890 gene, herein designated GAM GENE, encodes a GAM1890 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1890 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1890 precursor RNA is designated SEQ ID:1867, and is provided hereinbelow with reference to the sequence listing part.

[26333] GAM1890 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1890 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[26334] An enzyme complex designated DICER COMPLEX, dices the GAM1890 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1890 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM1890 RNA is designated SEQ ID:4475, and is provided hereinbelow with reference to the sequence listing part.

[26335] GAM1890 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1890 target RNA, herein designated GAM TARGET RNA. GAM1890 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[26336] GAM1890 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1890 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1890 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1890 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1890 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[26337] The complementary binding of GAM1890 RNA, herein designated GAM RNA, to target binding sites on GAM1890 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1890 target RNA, herein designated GAM TARGET RNA, into GAM1890 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[26338] It is appreciated that GAM1890 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1890 target genes. The

mRNA of each one of this plurality of GAM1890 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1890 RNA, herein designated GAM RNA, and which when bound by GAM1890 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1890 target proteins.

[26339] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1890 gene, herein designated GAM GENE, on one or more GAM1890 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[26340] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1890 correlate with, and may be deduced from, the identity of the target genes which GAM1890 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[26341] Nucleotide sequences of the GAM1890 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1890 RNA, herein

designated GAM RNA, and a schematic representation of the secondary folding of GAM1890 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1890 are further described hereinbelow with reference to Table 1.

[26342] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1890 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[26343] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1891 (GAM1891) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[26344] GAM1891 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1891 was detected is described hereinabove with reference to Figs. 2-8.

[26345] GAM1891 gene, herein designated GAM GENE, and GAM1891 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[26346] GAM1891 gene, herein designated GAM GENE, encodes a GAM1891 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1891 precursor RNA,

herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1891 precursor RNA is designated SEQ ID:1868, and is provided hereinbelow with reference to the sequence listing part.

[26347] GAM1891 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1891 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[26348] An enzyme complex designated DICER COMPLEX, dices the GAM1891 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1891 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 78%) nucleotide sequence of GAM1891 RNA is designated SEQ ID:4476, and is provided hereinbelow with reference to the sequence listing part.

[26349] GAM1891 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1891 target RNA, herein designated GAM TARGET RNA. GAM1891 target RNA, herein designated GAM

TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[26350] GAM1891 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1891 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1891 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1891 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1891 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[26351] The complementary binding of GAM1891 RNA, herein designated GAM RNA, to target binding sites on GAM1891 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1891 target RNA, herein designated GAM TARGET RNA, into GAM1891 target protein, herein

designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[26352] It is appreciated that GAM1891 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1891 target genes. The mRNA of each one of this plurality of GAM1891 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1891 RNA, herein designated GAM RNA, and which when bound by GAM1891 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1891 target proteins.

[26353] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1891 gene, herein designated GAM GENE, on one or more GAM1891 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[26354] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1891 correlate with, and may be deduced from, the identity of the target

genes which GAM1891 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[26355] Nucleotide sequences of the GAM1891 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1891 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1891 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1891 are further described hereinbelow with reference to Table 1.

[26356] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1891 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[26357] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1892 (GAM1892) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[26358] GAM1892 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1892 was detected is described hereinabove with reference to Figs. 2-8.

[26359] GAM1892 gene, herein designated GAM GENE, and GAM1892 target gene, herein designated GAM TARGET GENE, are human genes contained in the

human genome.

[26360] GAM1892 gene, herein designated GAM GENE, encodes a GAM1892 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1892 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1892 precursor RNA is designated SEQ ID:1869, and is provided hereinbelow with reference to the sequence listing part.

[26361] GAM1892 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1892 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[26362] An enzyme complex designated DICER COMPLEX, dices the GAM1892 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1892 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 82%) nucleotide sequence of GAM1892 RNA is designated SEQ ID:4477, and is provided

hereinbelow with reference to the sequence listing part.

[26363] GAM1892 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1892 target RNA, herein designated GAM TARGET RNA. GAM1892 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[26364] GAM1892 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1892 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1892 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1892 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1892 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[26365] The complementary binding of GAM1892 RNA, herein designated GAM RNA, to target binding sites on GAM1892 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1892 target RNA, herein designated GAM TARGET RNA, into GAM1892 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[26366] It is appreciated that GAM1892 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1892 target genes. The mRNA of each one of this plurality of GAM1892 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1892 RNA, herein designated GAM RNA, and which when bound by GAM1892 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1892 target proteins.

[26367] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1892 gene, herein designated GAM GENE, on one or more GAM1892 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding

sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[26368] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1892 correlate with, and may be deduced from, the identity of the target genes which GAM1892 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[26369] Nucleotide sequences of the GAM1892 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1892 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1892 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1892 are further described hereinbelow with reference to Table 1.

[26370] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1892 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[26371] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1893 (GAM1893) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[26372] GAM1893 is a novel bioinformatically detected regulatory, non protein

coding, micro RNA (miRNA) gene. The method by which GAM1893 was detected is described hereinabove with reference to Figs. 2-8.

[26373] GAM1893 gene, herein designated GAM GENE, and GAM1893 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[26374] GAM1893 gene, herein designated GAM GENE, encodes a GAM1893 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1893 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1893 precursor RNA is designated SEQ ID:1870, and is provided hereinbelow with reference to the sequence listing part.

[26375] GAM1893 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1893 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[26376] An enzyme complex designated DICER COMPLEX, dices the GAM1893 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1893 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin

structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 82%) nucleotide sequence of GAM1893 RNA is designated SEQ ID:4478, and is provided hereinbelow with reference to the sequence listing part.

[26377] GAM1893 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1893 target RNA, herein designated GAM TARGET RNA. GAM1893 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[26378] GAM1893 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1893 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1893 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1893 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1893 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target

binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[26379] The complementary binding of GAM1893 RNA, herein designated GAM RNA, to target binding sites on GAM1893 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1893 target RNA, herein designated GAM TARGET RNA, into GAM1893 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[26380] It is appreciated that GAM1893 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1893 target genes. The mRNA of each one of this plurality of GAM1893 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1893 RNA, herein designated GAM RNA, and which when bound by GAM1893 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1893 target proteins.

[26381] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1893 gene, herein designated GAM GENE, on one or more GAM1893 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary

binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[26382] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1893 correlate with, and may be deduced from, the identity of the target genes which GAM1893 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[26383] Nucleotide sequences of the GAM1893 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1893 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1893 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1893 are further described hereinbelow with reference to Table 1.

[26384] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1893 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[26385] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1894 (GAM1894) gene, which modulates

expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[26386] GAM1894 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1894 was detected is described hereinabove with reference to Figs. 2-8.

[26387] GAM1894 gene, herein designated GAM GENE, and GAM1894 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[26388] GAM1894 gene, herein designated GAM GENE, encodes a GAM1894 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1894 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1894 precursor RNA is designated SEQ ID:1871, and is provided hereinbelow with reference to the sequence listing part.

[26389] GAM1894 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1894 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[26390] An enzyme complex designated DICER COMPLEX, dices the GAM1894 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1894 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 80%) nucleotide sequence of GAM1894 RNA is designated SEQ ID:4479, and is provided hereinbelow with reference to the sequence listing part.

[26391] GAM1894 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1894 target RNA, herein designated GAM TARGET RNA. GAM1894 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[26392] GAM1894 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1894 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1894 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an

illustration only, and is not meant to be limiting GAM1894 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1894 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[26393] The complementary binding of GAM1894 RNA, herein designated GAM RNA, to target binding sites on GAM1894 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1894 target RNA, herein designated GAM TARGET RNA, into GAM1894 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[26394] It is appreciated that GAM1894 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1894 target genes. The mRNA of each one of this plurality of GAM1894 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1894 RNA, herein designated GAM RNA, and which when bound by GAM1894 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1894 target proteins.

[26395] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition

exerted by GAM1894 gene, herein designated GAM GENE, on one or more GAM1894 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[26396] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1894 correlate with, and may be deduced from, the identity of the target genes which GAM1894 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[26397] Nucleotide sequences of the GAM1894 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1894 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1894 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1894 are further described hereinbelow with reference to Table 1.

[26398] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1894 RNA, herein designated GAM RNA, are described hereinbelow

with reference to Table 2.

[26399] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1895 (GAM1895) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[26400] GAM1895 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1895 was detected is described hereinabove with reference to Figs. 2-8.

[26401] GAM1895 gene, herein designated GAM GENE, and GAM1895 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[26402] GAM1895 gene, herein designated GAM GENE, encodes a GAM1895 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1895 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1895 precursor RNA is designated SEQ ID:1872, and is provided hereinbelow with reference to the sequence listing part.

[26403] GAM1895 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1895 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA

encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[26404] An enzyme complex designated DICER COMPLEX, dices the GAM1895 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1895 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 85%) nucleotide sequence of GAM1895 RNA is designated SEQ ID:4480, and is provided hereinbelow with reference to the sequence listing part.

[26405] GAM1895 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1895 target RNA, herein designated GAM TARGET RNA. GAM1895 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[26406] GAM1895 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1895 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1895 RNA,

herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1895 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1895 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[26407] The complementary binding of GAM1895 RNA, herein designated GAM RNA, to target binding sites on GAM1895 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1895 target RNA, herein designated GAM TARGET RNA, into GAM1895 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[26408] It is appreciated that GAM1895 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1895 target genes. The mRNA of each one of this plurality of GAM1895 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1895 RNA, herein designated GAM RNA, and which when bound by GAM1895 RNA, herein designated GAM RNA,

causes inhibition of translation of respective one or more GAM1895 target proteins.

[26409] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1895 gene, herein designated GAM GENE, on one or more GAM1895 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[26410] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1895 correlate with, and may be deduced from, the identity of the target genes which GAM1895 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[26411] Nucleotide sequences of the GAM1895 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1895 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1895 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1895 are further described hereinbelow with reference to Table 1.

[26412] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1895 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[26413] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1896 (GAM1896) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[26414] GAM1896 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1896 was detected is described hereinabove with reference to Figs. 2-8.

[26415] GAM1896 gene, herein designated GAM GENE, and GAM1896 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[26416] GAM1896 gene, herein designated GAM GENE, encodes a GAM1896 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1896 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1896 precursor RNA is designated SEQ ID:1873, and is provided hereinbelow with reference to the sequence listing part.

[26417] GAM1896 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1896 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[26418] An enzyme complex designated DICER COMPLEX, dices the GAM1896 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1896 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 82%) nucleotide sequence of GAM1896 RNA is designated SEQ ID:4481, and is provided hereinbelow with reference to the sequence listing part.

[26419] GAM1896 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1896 target RNA, herein designated GAM TARGET RNA. GAM1896 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[26420] GAM1896 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1896 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1896 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1896 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1896 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[26421] The complementary binding of GAM1896 RNA, herein designated GAM RNA, to target binding sites on GAM1896 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1896 target RNA, herein designated GAM TARGET RNA, into GAM1896 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[26422] It is appreciated that GAM1896 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1896 target genes. The

mRNA of each one of this plurality of GAM1896 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1896 RNA, herein designated GAM RNA, and which when bound by GAM1896 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1896 target proteins.

[26423] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1896 gene, herein designated GAM GENE, on one or more GAM1896 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[26424] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1896 correlate with, and may be deduced from, the identity of the target genes which GAM1896 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[26425] Nucleotide sequences of the GAM1896 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1896 RNA, herein

designated GAM RNA, and a schematic representation of the secondary folding of GAM1896 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1896 are further described hereinbelow with reference to Table 1.

[26426] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1896 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[26427] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1897 (GAM1897) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[26428] GAM1897 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1897 was detected is described hereinabove with reference to Figs. 2-8.

[26429] GAM1897 gene, herein designated GAM GENE, and GAM1897 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[26430] GAM1897 gene, herein designated GAM GENE, encodes a GAM1897 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1897 precursor RNA,

herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1897 precursor RNA is designated SEQ ID:1874, and is provided hereinbelow with reference to the sequence listing part.

[26431] GAM1897 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1897 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[26432] An enzyme complex designated DICER COMPLEX, dices the GAM1897 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1897 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM1897 RNA is designated SEQ ID:4482, and is provided hereinbelow with reference to the sequence listing part.

[26433] GAM1897 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1897 target RNA, herein designated GAM TARGET RNA. GAM1897 target RNA, herein designated GAM

TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[26434] GAM1897 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1897 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1897 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1897 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1897 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[26435] The complementary binding of GAM1897 RNA, herein designated GAM RNA, to target binding sites on GAM1897 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1897 target RNA, herein designated GAM TARGET RNA, into GAM1897 target protein, herein

designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[26436] It is appreciated that GAM1897 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1897 target genes. The mRNA of each one of this plurality of GAM1897 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1897 RNA, herein designated GAM RNA, and which when bound by GAM1897 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1897 target proteins.

[26437] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1897 gene, herein designated GAM GENE, on one or more GAM1897 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[26438] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1897 correlate with, and may be deduced from, the identity of the target

genes which GAM1897 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[26439] Nucleotide sequences of the GAM1897 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1897 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1897 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1897 are further described hereinbelow with reference to Table 1.

[26440] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1897 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[26441] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1898 (GAM1898) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[26442] GAM1898 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1898 was detected is described hereinabove with reference to Figs. 2-8.

[26443] GAM1898 gene, herein designated GAM GENE, and GAM1898 target gene, herein designated GAM TARGET GENE, are human genes contained in the

human genome.

[26444] GAM1898 gene, herein designated GAM GENE, encodes a GAM1898 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1898 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1898 precursor RNA is designated SEQ ID:1875, and is provided hereinbelow with reference to the sequence listing part.

[26445] GAM1898 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1898 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[26446] An enzyme complex designated DICER COMPLEX, dices the GAM1898 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1898 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 88%) nucleotide sequence of GAM1898 RNA is designated SEQ ID:4483, and is provided

hereinbelow with reference to the sequence listing part.

[26447] GAM1898 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1898 target RNA, herein designated GAM TARGET RNA. GAM1898 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[26448] GAM1898 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1898 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1898 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1898 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1898 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[26449] The complementary binding of GAM1898 RNA, herein designated GAM RNA, to target binding sites on GAM1898 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1898 target RNA, herein designated GAM TARGET RNA, into GAM1898 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[26450] It is appreciated that GAM1898 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1898 target genes. The mRNA of each one of this plurality of GAM1898 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1898 RNA, herein designated GAM RNA, and which when bound by GAM1898 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1898 target proteins.

[26451] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1898 gene, herein designated GAM GENE, on one or more GAM1898 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding

sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[26452] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1898 correlate with, and may be deduced from, the identity of the target genes which GAM1898 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[26453] Nucleotide sequences of the GAM1898 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1898 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1898 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1898 are further described hereinbelow with reference to Table 1.

[26454] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1898 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[26455] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1899 (GAM1899) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[26456] GAM1899 is a novel bioinformatically detected regulatory, non protein

coding, micro RNA (miRNA) gene. The method by which GAM1899 was detected is described hereinabove with reference to Figs. 2-8.

[26457] GAM1899 gene, herein designated GAM GENE, and GAM1899 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[26458] GAM1899 gene, herein designated GAM GENE, encodes a GAM1899 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1899 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1899 precursor RNA is designated SEQ ID:1876, and is provided hereinbelow with reference to the sequence listing part.

[26459] GAM1899 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1899 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[26460] An enzyme complex designated DICER COMPLEX, dices the GAM1899 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1899 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin

structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 94%) nucleotide sequence of GAM1899 RNA is designated SEQ ID:4484, and is provided hereinbelow with reference to the sequence listing part.

[26461] GAM1899 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1899 target RNA, herein designated GAM TARGET RNA. GAM1899 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[26462] GAM1899 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1899 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1899 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1899 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1899 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target

binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[26463] The complementary binding of GAM1899 RNA, herein designated GAM RNA, to target binding sites on GAM1899 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1899 target RNA, herein designated GAM TARGET RNA, into GAM1899 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[26464] It is appreciated that GAM1899 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1899 target genes. The mRNA of each one of this plurality of GAM1899 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1899 RNA, herein designated GAM RNA, and which when bound by GAM1899 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1899 target proteins.

[26465] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1899 gene, herein designated GAM GENE, on one or more GAM1899 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary

binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[26466] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1899 correlate with, and may be deduced from, the identity of the target genes which GAM1899 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[26467] Nucleotide sequences of the GAM1899 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1899 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1899 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1899 are further described hereinbelow with reference to Table 1.

[26468] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1899 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[26469] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1900 (GAM1900) gene, which modulates

expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[26470] GAM1900 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1900 was detected is described hereinabove with reference to Figs. 2-8.

[26471] GAM1900 gene, herein designated GAM GENE, and GAM1900 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[26472] GAM1900 gene, herein designated GAM GENE, encodes a GAM1900 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1900 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1900 precursor RNA is designated SEQ ID:1877, and is provided hereinbelow with reference to the sequence listing part.

[26473] GAM1900 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1900 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[26474] An enzyme complex designated DICER COMPLEX, dices the GAM1900 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1900 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 89%) nucleotide sequence of GAM1900 RNA is designated SEQ ID:4485, and is provided hereinbelow with reference to the sequence listing part.

[26475] GAM1900 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1900 target RNA, herein designated GAM TARGET RNA. GAM1900 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[26476] GAM1900 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1900 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1900 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an

illustration only, and is not meant to be limiting GAM1900 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1900 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[26477] The complementary binding of GAM1900 RNA, herein designated GAM RNA, to target binding sites on GAM1900 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1900 target RNA, herein designated GAM TARGET RNA, into GAM1900 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[26478] It is appreciated that GAM1900 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1900 target genes. The mRNA of each one of this plurality of GAM1900 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1900 RNA, herein designated GAM RNA, and which when bound by GAM1900 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1900 target proteins.

[26479] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition

exerted by GAM1900 gene, herein designated GAM GENE, on one or more GAM1900 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[26480] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1900 correlate with, and may be deduced from, the identity of the target genes which GAM1900 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[26481] Nucleotide sequences of the GAM1900 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1900 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1900 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1900 are further described hereinbelow with reference to Table 1.

[26482] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1900 RNA, herein designated GAM RNA, are described hereinbelow

with reference to Table 2.

[26483] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1901 (GAM1901) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[26484] GAM1901 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1901 was detected is described hereinabove with reference to Figs. 2-8.

[26485] GAM1901 gene, herein designated GAM GENE, and GAM1901 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[26486] GAM1901 gene, herein designated GAM GENE, encodes a GAM1901 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1901 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1901 precursor RNA is designated SEQ ID:1878, and is provided hereinbelow with reference to the sequence listing part.

[26487] GAM1901 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1901 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA

encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[26488] An enzyme complex designated DICER COMPLEX, dices the GAM1901 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1901 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 87%) nucleotide sequence of GAM1901 RNA is designated SEQ ID:4486, and is provided hereinbelow with reference to the sequence listing part.

[26489] GAM1901 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1901 target RNA, herein designated GAM TARGET RNA. GAM1901 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[26490] GAM1901 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1901 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1901 RNA,

herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1901 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1901 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[26491] The complementary binding of GAM1901 RNA, herein designated GAM RNA, to target binding sites on GAM1901 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1901 target RNA, herein designated GAM TARGET RNA, into GAM1901 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[26492] It is appreciated that GAM1901 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1901 target genes. The mRNA of each one of this plurality of GAM1901 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1901 RNA, herein designated GAM RNA, and which when bound by GAM1901 RNA, herein designated GAM RNA,

causes inhibition of translation of respective one or more GAM1901 target proteins.

[26493] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1901 gene, herein designated GAM GENE, on one or more GAM1901 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[26494] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1901 correlate with, and may be deduced from, the identity of the target genes which GAM1901 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[26495] Nucleotide sequences of the GAM1901 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1901 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1901 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1901 are further described hereinbelow with reference to Table 1.

[26496] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1901 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[26497] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1902 (GAM1902) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[26498] GAM1902 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1902 was detected is described hereinabove with reference to Figs. 2-8.

[26499] GAM1902 gene, herein designated GAM GENE, and GAM1902 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[26500] GAM1902 gene, herein designated GAM GENE, encodes a GAM1902 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1902 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1902 precursor RNA is designated SEQ ID:1879, and is provided hereinbelow with reference to the sequence listing part.

[26501] GAM1902 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1902 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[26502] An enzyme complex designated DICER COMPLEX, dices the GAM1902 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1902 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 25%) nucleotide sequence of GAM1902 RNA is designated SEQ ID:4487, and is provided hereinbelow with reference to the sequence listing part.

[26503] GAM1902 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1902 target RNA, herein designated GAM TARGET RNA. GAM1902 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[26504] GAM1902 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1902 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1902 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1902 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1902 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[26505] The complementary binding of GAM1902 RNA, herein designated GAM RNA, to target binding sites on GAM1902 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1902 target RNA, herein designated GAM TARGET RNA, into GAM1902 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[26506] It is appreciated that GAM1902 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1902 target genes. The

mRNA of each one of this plurality of GAM1902 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1902 RNA, herein designated GAM RNA, and which when bound by GAM1902 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1902 target proteins.

[26507] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1902 gene, herein designated GAM GENE, on one or more GAM1902 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[26508] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1902 correlate with, and may be deduced from, the identity of the target genes which GAM1902 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[26509] Nucleotide sequences of the GAM1902 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1902 RNA, herein

designated GAM RNA, and a schematic representation of the secondary folding of GAM1902 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1902 are further described hereinbelow with reference to Table 1.

[26510] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1902 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[26511] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1903 (GAM1903) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[26512] GAM1903 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1903 was detected is described hereinabove with reference to Figs. 2-8.

[26513] GAM1903 gene, herein designated GAM GENE, and GAM1903 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[26514] GAM1903 gene, herein designated GAM GENE, encodes a GAM1903 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1903 precursor RNA,

herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1903 precursor RNA is designated SEQ ID:1880, and is provided hereinbelow with reference to the sequence listing part.

[26515] GAM1903 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1903 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[26516] An enzyme complex designated DICER COMPLEX, dices the GAM1903 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1903 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 88%) nucleotide sequence of GAM1903 RNA is designated SEQ ID:4488, and is provided hereinbelow with reference to the sequence listing part.

[26517] GAM1903 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1903 target RNA, herein designated GAM TARGET RNA. GAM1903 target RNA, herein designated GAM

TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[26518] GAM1903 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1903 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1903 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1903 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1903 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[26519] The complementary binding of GAM1903 RNA, herein designated GAM RNA, to target binding sites on GAM1903 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1903 target RNA, herein designated GAM TARGET RNA, into GAM1903 target protein, herein

designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[26520] It is appreciated that GAM1903 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1903 target genes. The mRNA of each one of this plurality of GAM1903 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1903 RNA, herein designated GAM RNA, and which when bound by GAM1903 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1903 target proteins.

[26521] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1903 gene, herein designated GAM GENE, on one or more GAM1903 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[26522] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1903 correlate with, and may be deduced from, the identity of the target genes which GAM1903 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[26523] Nucleotide sequences of the GAM1903 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1903 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1903 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1903 are further described hereinbelow with reference to Table 1.

[26524] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1903 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[26525] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1904 (GAM1904) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[26526] GAM1904 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1904 was detected is described hereinabove with reference to Figs. 2-8.

[26527] GAM1904 gene, herein designated GAM GENE, and GAM1904 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[26528] GAM1904 gene, herein designated GAM GENE, encodes a GAM1904

precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1904 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1904 precursor RNA is designated SEQ ID:1881, and is provided hereinbelow with reference to the sequence listing part.

[26529] GAM1904 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1904 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[26530] An enzyme complex designated DICER COMPLEX, dices the GAM1904 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1904 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 86%) nucleotide sequence of GAM1904 RNA is designated SEQ ID:4489, and is provided hereinbelow with reference to the sequence listing part.

[26531] GAM1904 target gene, herein designated GAM TARGET GENE, encodes a

corresponding messenger RNA, GAM1904 target RNA, herein designated GAM TARGET RNA. GAM1904 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[26532] GAM1904 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1904 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1904 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1904 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1904 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[26533] The complementary binding of GAM1904 RNA, herein designated GAM RNA, to target binding sites on GAM1904 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and

BINDING SITE III, inhibits translation of GAM1904 target RNA, herein designated GAM TARGET RNA, into GAM1904 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[26534] It is appreciated that GAM1904 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1904 target genes. The mRNA of each one of this plurality of GAM1904 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1904 RNA, herein designated GAM RNA, and which when bound by GAM1904 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1904 target proteins.

[26535] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1904 gene, herein designated GAM GENE, on one or more GAM1904 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[26536] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1904 correlate with, and may be deduced from, the identity of the target genes which GAM1904 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[26537] Nucleotide sequences of the GAM1904 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1904 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1904 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1904 are further described hereinbelow with reference to Table 1.

[26538] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1904 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[26539] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1905 (GAM1905) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[26540] GAM1905 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1905 was detected is described hereinabove with reference to Figs. 2-8.

[26541] GAM1905 gene, herein designated GAM GENE, and GAM1905 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[26542] GAM1905 gene, herein designated GAM GENE, encodes a GAM1905 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1905 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1905 precursor RNA is designated SEQ ID:1882, and is provided hereinbelow with reference to the sequence listing part.

[26543] GAM1905 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1905 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[26544] An enzyme complex designated DICER COMPLEX, dices the GAM1905 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1905 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer

together with other necessary proteins. A probable (over 76%) nucleotide sequence of GAM1905 RNA is designated SEQ ID:4490, and is provided hereinbelow with reference to the sequence listing part.

[26545] GAM1905 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1905 target RNA, herein designated GAM TARGET RNA. GAM1905 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[26546] GAM1905 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1905 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1905 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1905 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1905 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or

in both 3UTR and 5UTR regions.

[26547] The complementary binding of GAM1905 RNA, herein designated GAM RNA, to target binding sites on GAM1905 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1905 target RNA, herein designated GAM TARGET RNA, into GAM1905 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[26548] It is appreciated that GAM1905 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1905 target genes. The mRNA of each one of this plurality of GAM1905 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1905 RNA, herein designated GAM RNA, and which when bound by GAM1905 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1905 target proteins.

[26549] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1905 gene, herein designated GAM GENE, on one or more GAM1905 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes

are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[26550] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1905 correlate with, and may be deduced from, the identity of the target genes which GAM1905 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[26551] Nucleotide sequences of the GAM1905 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1905 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1905 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1905 are further described hereinbelow with reference to Table 1.

[26552] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1905 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[26553] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1906 (GAM1906) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[26554] GAM1906 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1906 was detected is described hereinabove with reference to Figs. 2-8.

[26555] GAM1906 gene, herein designated GAM GENE, and GAM1906 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[26556] GAM1906 gene, herein designated GAM GENE, encodes a GAM1906 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1906 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1906 precursor RNA is designated SEQ ID:1883, and is provided hereinbelow with reference to the sequence listing part.

[26557] GAM1906 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1906 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[26558] An enzyme complex designated DICER COMPLEX, dices the GAM1906 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1906 RNA, herein designated GAM RNA, a single stranded

~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 86%) nucleotide sequence of GAM1906 RNA is designated SEQ ID:4491, and is provided hereinbelow with reference to the sequence listing part.

[26559] GAM1906 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1906 target RNA, herein designated GAM TARGET RNA. GAM1906 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[26560] GAM1906 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1906 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1906 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1906 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1906 target RNA, herein designated GAM

TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[26561] The complementary binding of GAM1906 RNA, herein designated GAM RNA, to target binding sites on GAM1906 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1906 target RNA, herein designated GAM TARGET RNA, into GAM1906 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[26562] It is appreciated that GAM1906 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1906 target genes. The mRNA of each one of this plurality of GAM1906 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1906 RNA, herein designated GAM RNA, and which when bound by GAM1906 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1906 target proteins.

[26563] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1906 gene, herein designated GAM GENE, on one or more GAM1906 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with

reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[26564] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1906 correlate with, and may be deduced from, the identity of the target genes which GAM1906 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[26565] Nucleotide sequences of the GAM1906 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1906 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1906 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1906 are further described hereinbelow with reference to Table 1.

[26566] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1906 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[26567] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as

Genomic Address Messenger 1907 (GAM1907) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[26568] GAM1907 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1907 was detected is described hereinabove with reference to Figs. 2-8.

[26569] GAM1907 gene, herein designated GAM GENE, and GAM1907 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[26570] GAM1907 gene, herein designated GAM GENE, encodes a GAM1907 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1907 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1907 precursor RNA is designated SEQ ID:1884, and is provided hereinbelow with reference to the sequence listing part.

[26571] GAM1907 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1907 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[26572] An enzyme complex designated DICER COMPLEX, dices the GAM1907 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1907 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 86%) nucleotide sequence of GAM1907 RNA is designated SEQ ID:4492, and is provided hereinbelow with reference to the sequence listing part.

[26573] GAM1907 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1907 target RNA, herein designated GAM TARGET RNA. GAM1907 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[26574] GAM1907 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1907 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1907 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an

illustration only, and is not meant to be limiting GAM1907 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1907 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[26575] The complementary binding of GAM1907 RNA, herein designated GAM RNA, to target binding sites on GAM1907 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1907 target RNA, herein designated GAM TARGET RNA, into GAM1907 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[26576] It is appreciated that GAM1907 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1907 target genes. The mRNA of each one of this plurality of GAM1907 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1907 RNA, herein designated GAM RNA, and which when bound by GAM1907 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1907 target proteins.

[26577] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition

exerted by GAM1907 gene, herein designated GAM GENE, on one or more GAM1907 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[26578] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1907 correlate with, and may be deduced from, the identity of the target genes which GAM1907 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[26579] Nucleotide sequences of the GAM1907 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1907 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1907 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1907 are further described hereinbelow with reference to Table 1.

[26580] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1907 RNA, herein designated GAM RNA, are described hereinbelow

with reference to Table 2.

[26581] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1908 (GAM1908) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[26582] GAM1908 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1908 was detected is described hereinabove with reference to Figs. 2-8.

[26583] GAM1908 gene, herein designated GAM GENE, and GAM1908 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[26584] GAM1908 gene, herein designated GAM GENE, encodes a GAM1908 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1908 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1908 precursor RNA is designated SEQ ID:1885, and is provided hereinbelow with reference to the sequence listing part.

[26585] GAM1908 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1908 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA

encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[26586] An enzyme complex designated DICER COMPLEX, dices the GAM1908 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1908 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 78%) nucleotide sequence of GAM1908 RNA is designated SEQ ID:4493, and is provided hereinbelow with reference to the sequence listing part.

[26587] GAM1908 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1908 target RNA, herein designated GAM TARGET RNA. GAM1908 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[26588] GAM1908 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1908 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1908 RNA,

herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1908 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1908 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[26589] The complementary binding of GAM1908 RNA, herein designated GAM RNA, to target binding sites on GAM1908 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1908 target RNA, herein designated GAM TARGET RNA, into GAM1908 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[26590] It is appreciated that GAM1908 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1908 target genes. The mRNA of each one of this plurality of GAM1908 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1908 RNA, herein designated GAM RNA, and which when bound by GAM1908 RNA, herein designated GAM RNA,

causes inhibition of translation of respective one or more GAM1908 target proteins.

[26591] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1908 gene, herein designated GAM GENE, on one or more GAM1908 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[26592] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1908 correlate with, and may be deduced from, the identity of the target genes which GAM1908 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[26593] Nucleotide sequences of the GAM1908 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1908 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1908 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1908 are further described hereinbelow with reference to Table 1.

[26594] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1908 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[26595] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1909 (GAM1909) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[26596] GAM1909 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1909 was detected is described hereinabove with reference to Figs. 2-8.

[26597] GAM1909 gene, herein designated GAM GENE, and GAM1909 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[26598] GAM1909 gene, herein designated GAM GENE, encodes a GAM1909 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1909 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1909 precursor RNA is designated SEQ ID:1886, and is provided hereinbelow with reference to the sequence listing part.

[26599] GAM1909 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1909 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[26600] An enzyme complex designated DICER COMPLEX, dices the GAM1909 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1909 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 79%) nucleotide sequence of GAM1909 RNA is designated SEQ ID:4495, and is provided hereinbelow with reference to the sequence listing part.

[26601] GAM1909 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1909 target RNA, herein designated GAM TARGET RNA. GAM1909 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[26602] GAM1909 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1909 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1909 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1909 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1909 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[26603] The complementary binding of GAM1909 RNA, herein designated GAM RNA, to target binding sites on GAM1909 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1909 target RNA, herein designated GAM TARGET RNA, into GAM1909 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[26604] It is appreciated that GAM1909 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1909 target genes. The

mRNA of each one of this plurality of GAM1909 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1909 RNA, herein designated GAM RNA, and which when bound by GAM1909 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1909 target proteins.

[26605] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1909 gene, herein designated GAM GENE, on one or more GAM1909 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[26606] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1909 correlate with, and may be deduced from, the identity of the target genes which GAM1909 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[26607] Nucleotide sequences of the GAM1909 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1909 RNA, herein

designated GAM RNA, and a schematic representation of the secondary folding of GAM1909 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1909 are further described hereinbelow with reference to Table 1.

[26608] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1909 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[26609] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1910 (GAM1910) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[26610] GAM1910 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1910 was detected is described hereinabove with reference to Figs. 2-8.

[26611] GAM1910 gene, herein designated GAM GENE, and GAM1910 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[26612] GAM1910 gene, herein designated GAM GENE, encodes a GAM1910 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1910 precursor RNA,

herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1910 precursor RNA is designated SEQ ID:1887, and is provided hereinbelow with reference to the sequence listing part.

[26613] GAM1910 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1910 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[26614] An enzyme complex designated DICER COMPLEX, dices the GAM1910 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1910 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 84%) nucleotide sequence of GAM1910 RNA is designated SEQ ID:4494, and is provided hereinbelow with reference to the sequence listing part.

[26615] GAM1910 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1910 target RNA, herein designated GAM TARGET RNA. GAM1910 target RNA, herein designated GAM

TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[26616] GAM1910 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1910 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1910 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1910 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1910 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[26617] The complementary binding of GAM1910 RNA, herein designated GAM RNA, to target binding sites on GAM1910 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1910 target RNA, herein designated GAM TARGET RNA, into GAM1910 target protein, herein

designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[26618] It is appreciated that GAM1910 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1910 target genes. The mRNA of each one of this plurality of GAM1910 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1910 RNA, herein designated GAM RNA, and which when bound by GAM1910 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1910 target proteins.

[26619] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1910 gene, herein designated GAM GENE, on one or more GAM1910 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[26620] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1910 correlate with, and may be deduced from, the identity of the target

genes which GAM1910 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[26621] Nucleotide sequences of the GAM1910 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1910 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1910 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1910 are further described hereinbelow with reference to Table 1.

[26622] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1910 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[26623] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1911 (GAM1911) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[26624] GAM1911 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1911 was detected is described hereinabove with reference to Figs. 2-8.

[26625] GAM1911 gene, herein designated GAM GENE, and GAM1911 target gene, herein designated GAM TARGET GENE, are human genes contained in the

human genome.

[26626] GAM1911 gene, herein designated GAM GENE, encodes a GAM1911 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1911 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1911 precursor RNA is designated SEQ ID:1888, and is provided hereinbelow with reference to the sequence listing part.

[26627] GAM1911 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1911 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[26628] An enzyme complex designated DICER COMPLEX, dices the GAM1911 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1911 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM1911 RNA is designated SEQ ID:4496, and is provided

hereinbelow with reference to the sequence listing part.

[26629] GAM1911 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1911 target RNA, herein designated GAM TARGET RNA. GAM1911 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[26630] GAM1911 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1911 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1911 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1911 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1911 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[26631] The complementary binding of GAM1911 RNA, herein designated GAM RNA, to target binding sites on GAM1911 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1911 target RNA, herein designated GAM TARGET RNA, into GAM1911 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[26632] It is appreciated that GAM1911 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1911 target genes. The mRNA of each one of this plurality of GAM1911 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1911 RNA, herein designated GAM RNA, and which when bound by GAM1911 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1911 target proteins.

[26633] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1911 gene, herein designated GAM GENE, on one or more GAM1911 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding

sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[26634] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1911 correlate with, and may be deduced from, the identity of the target genes which GAM1911 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[26635] Nucleotide sequences of the GAM1911 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1911 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1911 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1911 are further described hereinbelow with reference to Table 1.

[26636] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1911 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[26637] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1912 (GAM1912) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[26638] GAM1912 is a novel bioinformatically detected regulatory, non protein

coding, micro RNA (miRNA) gene. The method by which GAM1912 was detected is described hereinabove with reference to Figs. 2-8.

[26639] GAM1912 gene, herein designated GAM GENE, and GAM1912 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[26640] GAM1912 gene, herein designated GAM GENE, encodes a GAM1912 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1912 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1912 precursor RNA is designated SEQ ID:1889, and is provided hereinbelow with reference to the sequence listing part.

[26641] GAM1912 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1912 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[26642] An enzyme complex designated DICER COMPLEX, dices the GAM1912 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1912 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin

structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 91%) nucleotide sequence of GAM1912 RNA is designated SEQ ID:4497, and is provided hereinbelow with reference to the sequence listing part.

[26643] GAM1912 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1912 target RNA, herein designated GAM TARGET RNA. GAM1912 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[26644] GAM1912 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1912 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1912 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1912 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1912 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target

binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[26645] The complementary binding of GAM1912 RNA, herein designated GAM RNA, to target binding sites on GAM1912 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1912 target RNA, herein designated GAM TARGET RNA, into GAM1912 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[26646] It is appreciated that GAM1912 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1912 target genes. The mRNA of each one of this plurality of GAM1912 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1912 RNA, herein designated GAM RNA, and which when bound by GAM1912 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1912 target proteins.

[26647] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1912 gene, herein designated GAM GENE, on one or more GAM1912 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary

binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[26648] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1912 correlate with, and may be deduced from, the identity of the target genes which GAM1912 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[26649] Nucleotide sequences of the GAM1912 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1912 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1912 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1912 are further described hereinbelow with reference to Table 1.

[26650] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1912 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[26651] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1913 (GAM1913) gene, which modulates

expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[26652] GAM1913 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1913 was detected is described hereinabove with reference to Figs. 2-8.

[26653] GAM1913 gene, herein designated GAM GENE, and GAM1913 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[26654] GAM1913 gene, herein designated GAM GENE, encodes a GAM1913 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1913 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1913 precursor RNA is designated SEQ ID:1890, and is provided hereinbelow with reference to the sequence listing part.

[26655] GAM1913 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1913 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[26656] An enzyme complex designated DICER COMPLEX, dices the GAM1913 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1913 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 82%) nucleotide sequence of GAM1913 RNA is designated SEQ ID:4498, and is provided hereinbelow with reference to the sequence listing part.

[26657] GAM1913 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1913 target RNA, herein designated GAM TARGET RNA. GAM1913 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[26658] GAM1913 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1913 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1913 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an

illustration only, and is not meant to be limiting GAM1913 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1913 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[26659] The complementary binding of GAM1913 RNA, herein designated GAM RNA, to target binding sites on GAM1913 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1913 target RNA, herein designated GAM TARGET RNA, into GAM1913 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[26660] It is appreciated that GAM1913 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1913 target genes. The mRNA of each one of this plurality of GAM1913 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1913 RNA, herein designated GAM RNA, and which when bound by GAM1913 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1913 target proteins.

[26661] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition

exerted by GAM1913 gene, herein designated GAM GENE, on one or more GAM1913 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[26662] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1913 correlate with, and may be deduced from, the identity of the target genes which GAM1913 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[26663] Nucleotide sequences of the GAM1913 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1913 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1913 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1913 are further described hereinbelow with reference to Table 1.

[26664] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1913 RNA, herein designated GAM RNA, are described hereinbelow

with reference to Table 2.

[26665] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1914 (GAM1914) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[26666] GAM1914 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1914 was detected is described hereinabove with reference to Figs. 2-8.

[26667] GAM1914 gene, herein designated GAM GENE, and GAM1914 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[26668] GAM1914 gene, herein designated GAM GENE, encodes a GAM1914 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1914 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1914 precursor RNA is designated SEQ ID:1891, and is provided hereinbelow with reference to the sequence listing part.

[26669] GAM1914 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1914 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA

encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[26670] An enzyme complex designated DICER COMPLEX, dices the GAM1914 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1914 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 84%) nucleotide sequence of GAM1914 RNA is designated SEQ ID:4499, and is provided hereinbelow with reference to the sequence listing part.

[26671] GAM1914 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1914 target RNA, herein designated GAM TARGET RNA. GAM1914 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[26672] GAM1914 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1914 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1914 RNA,

herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1914 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1914 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[26673] The complementary binding of GAM1914 RNA, herein designated GAM RNA, to target binding sites on GAM1914 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1914 target RNA, herein designated GAM TARGET RNA, into GAM1914 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[26674] It is appreciated that GAM1914 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1914 target genes. The mRNA of each one of this plurality of GAM1914 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1914 RNA, herein designated GAM RNA, and which when bound by GAM1914 RNA, herein designated GAM RNA,

causes inhibition of translation of respective one or more GAM1914 target proteins.

[26675] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1914 gene, herein designated GAM GENE, on one or more GAM1914 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[26676] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1914 correlate with, and may be deduced from, the identity of the target genes which GAM1914 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[26677] Nucleotide sequences of the GAM1914 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1914 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1914 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1914 are further described hereinbelow with reference to Table 1.

[26678] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1914 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[26679] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1915 (GAM1915) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[26680] GAM1915 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1915 was detected is described hereinabove with reference to Figs. 2-8.

[26681] GAM1915 gene, herein designated GAM GENE, and GAM1915 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[26682] GAM1915 gene, herein designated GAM GENE, encodes a GAM1915 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1915 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1915 precursor RNA is designated SEQ ID:1892, and is provided hereinbelow with reference to the sequence listing part.

[26683] GAM1915 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1915 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[26684] An enzyme complex designated DICER COMPLEX, dices the GAM1915 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1915 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 78%) nucleotide sequence of GAM1915 RNA is designated SEQ ID:4501, and is provided hereinbelow with reference to the sequence listing part.

[26685] GAM1915 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1915 target RNA, herein designated GAM TARGET RNA. GAM1915 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[26686] GAM1915 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1915 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1915 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1915 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1915 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[26687] The complementary binding of GAM1915 RNA, herein designated GAM RNA, to target binding sites on GAM1915 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1915 target RNA, herein designated GAM TARGET RNA, into GAM1915 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[26688] It is appreciated that GAM1915 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1915 target genes. The

mRNA of each one of this plurality of GAM1915 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1915 RNA, herein designated GAM RNA, and which when bound by GAM1915 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1915 target proteins.

[26689] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1915 gene, herein designated GAM GENE, on one or more GAM1915 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[26690] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1915 correlate with, and may be deduced from, the identity of the target genes which GAM1915 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[26691] Nucleotide sequences of the GAM1915 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1915 RNA, herein

designated GAM RNA, and a schematic representation of the secondary folding of GAM1915 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1915 are further described hereinbelow with reference to Table 1.

[26692] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1915 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[26693] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1916 (GAM1916) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[26694] GAM1916 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1916 was detected is described hereinabove with reference to Figs. 2-8.

[26695] GAM1916 gene, herein designated GAM GENE, and GAM1916 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[26696] GAM1916 gene, herein designated GAM GENE, encodes a GAM1916 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1916 precursor RNA,

herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1916 precursor RNA is designated SEQ ID:1893, and is provided hereinbelow with reference to the sequence listing part.

[26697] GAM1916 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1916 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[26698] An enzyme complex designated DICER COMPLEX, dices the GAM1916 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1916 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 79%) nucleotide sequence of GAM1916 RNA is designated SEQ ID:4500, and is provided hereinbelow with reference to the sequence listing part.

[26699] GAM1916 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1916 target RNA, herein designated GAM TARGET RNA. GAM1916 target RNA, herein designated GAM

TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[26700] GAM1916 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1916 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1916 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1916 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1916 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[26701] The complementary binding of GAM1916 RNA, herein designated GAM RNA, to target binding sites on GAM1916 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1916 target RNA, herein designated GAM TARGET RNA, into GAM1916 target protein, herein

designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[26702] It is appreciated that GAM1916 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1916 target genes. The mRNA of each one of this plurality of GAM1916 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1916 RNA, herein designated GAM RNA, and which when bound by GAM1916 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1916 target proteins.

[26703] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1916 gene, herein designated GAM GENE, on one or more GAM1916 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[26704] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1916 correlate with, and may be deduced from, the identity of the target

genes which GAM1916 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[26705] Nucleotide sequences of the GAM1916 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1916 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1916 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1916 are further described hereinbelow with reference to Table 1.

[26706] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1916 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[26707] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1917 (GAM1917) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[26708] GAM1917 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1917 was detected is described hereinabove with reference to Figs. 2-8.

[26709] GAM1917 gene, herein designated GAM GENE, and GAM1917 target gene, herein designated GAM TARGET GENE, are human genes contained in the

human genome.

[26710] GAM1917 gene, herein designated GAM GENE, encodes a GAM1917 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1917 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1917 precursor RNA is designated SEQ ID:1894, and is provided hereinbelow with reference to the sequence listing part.

[26711] GAM1917 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1917 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[26712] An enzyme complex designated DICER COMPLEX, dices the GAM1917 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1917 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 79%) nucleotide sequence of GAM1917 RNA is designated SEQ ID:4502, and is provided

hereinbelow with reference to the sequence listing part.

[26713] GAM1917 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1917 target RNA, herein designated GAM TARGET RNA. GAM1917 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[26714] GAM1917 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1917 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1917 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1917 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1917 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[26715] The complementary binding of GAM1917 RNA, herein designated GAM RNA, to target binding sites on GAM1917 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1917 target RNA, herein designated GAM TARGET RNA, into GAM1917 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[26716] It is appreciated that GAM1917 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1917 target genes. The mRNA of each one of this plurality of GAM1917 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1917 RNA, herein designated GAM RNA, and which when bound by GAM1917 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1917 target proteins.

[26717] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1917 gene, herein designated GAM GENE, on one or more GAM1917 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding

sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[26718] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1917 correlate with, and may be deduced from, the identity of the target genes which GAM1917 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[26719] Nucleotide sequences of the GAM1917 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1917 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1917 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1917 are further described hereinbelow with reference to Table 1.

[26720] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1917 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[26721] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1918 (GAM1918) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[26722] GAM1918 is a novel bioinformatically detected regulatory, non protein

coding, micro RNA (miRNA) gene. The method by which GAM1918 was detected is described hereinabove with reference to Figs. 2-8.

[26723] GAM1918 gene, herein designated GAM GENE, and GAM1918 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[26724] GAM1918 gene, herein designated GAM GENE, encodes a GAM1918 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1918 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1918 precursor RNA is designated SEQ ID:1895, and is provided hereinbelow with reference to the sequence listing part.

[26725] GAM1918 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1918 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[26726] An enzyme complex designated DICER COMPLEX, dices the GAM1918 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1918 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin

structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM1918 RNA is designated SEQ ID:4503, and is provided hereinbelow with reference to the sequence listing part.

[26727] GAM1918 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1918 target RNA, herein designated GAM TARGET RNA. GAM1918 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[26728] GAM1918 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1918 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1918 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1918 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1918 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target

binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[26729] The complementary binding of GAM1918 RNA, herein designated GAM RNA, to target binding sites on GAM1918 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1918 target RNA, herein designated GAM TARGET RNA, into GAM1918 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[26730] It is appreciated that GAM1918 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1918 target genes. The mRNA of each one of this plurality of GAM1918 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1918 RNA, herein designated GAM RNA, and which when bound by GAM1918 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1918 target proteins.

[26731] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1918 gene, herein designated GAM GENE, on one or more GAM1918 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary

binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[26732] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1918 correlate with, and may be deduced from, the identity of the target genes which GAM1918 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[26733] Nucleotide sequences of the GAM1918 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1918 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1918 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1918 are further described hereinbelow with reference to Table 1.

[26734] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1918 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[26735] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1919 (GAM1919) gene, which modulates

expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[26736] GAM1919 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1919 was detected is described hereinabove with reference to Figs. 2-8.

[26737] GAM1919 gene, herein designated GAM GENE, and GAM1919 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[26738] GAM1919 gene, herein designated GAM GENE, encodes a GAM1919 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1919 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1919 precursor RNA is designated SEQ ID:1896, and is provided hereinbelow with reference to the sequence listing part.

[26739] GAM1919 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1919 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[26740] An enzyme complex designated DICER COMPLEX, dices the GAM1919 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1919 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 82%) nucleotide sequence of GAM1919 RNA is designated SEQ ID:4504, and is provided hereinbelow with reference to the sequence listing part.

[26741] GAM1919 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1919 target RNA, herein designated GAM TARGET RNA. GAM1919 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[26742] GAM1919 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1919 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1919 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an

illustration only, and is not meant to be limiting GAM1919 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1919 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[26743] The complementary binding of GAM1919 RNA, herein designated GAM RNA, to target binding sites on GAM1919 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1919 target RNA, herein designated GAM TARGET RNA, into GAM1919 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[26744] It is appreciated that GAM1919 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1919 target genes. The mRNA of each one of this plurality of GAM1919 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1919 RNA, herein designated GAM RNA, and which when bound by GAM1919 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1919 target proteins.

[26745] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition

exerted by GAM1919 gene, herein designated GAM GENE, on one or more GAM1919 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[26746] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1919 correlate with, and may be deduced from, the identity of the target genes which GAM1919 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[26747] Nucleotide sequences of the GAM1919 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1919 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1919 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1919 are further described hereinbelow with reference to Table 1.

[26748] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1919 RNA, herein designated GAM RNA, are described hereinbelow

with reference to Table 2.

[26749] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1920 (GAM1920) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[26750] GAM1920 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1920 was detected is described hereinabove with reference to Figs. 2-8.

[26751] GAM1920 gene, herein designated GAM GENE, and GAM1920 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[26752] GAM1920 gene, herein designated GAM GENE, encodes a GAM1920 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1920 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1920 precursor RNA is designated SEQ ID:1897, and is provided hereinbelow with reference to the sequence listing part.

[26753] GAM1920 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1920 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA

encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[26754] An enzyme complex designated DICER COMPLEX, dices the GAM1920 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1920 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 79%) nucleotide sequence of GAM1920 RNA is designated SEQ ID:4505, and is provided hereinbelow with reference to the sequence listing part.

[26755] GAM1920 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1920 target RNA, herein designated GAM TARGET RNA. GAM1920 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[26756] GAM1920 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1920 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1920 RNA,

herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1920 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1920 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[26757] The complementary binding of GAM1920 RNA, herein designated GAM RNA, to target binding sites on GAM1920 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1920 target RNA, herein designated GAM TARGET RNA, into GAM1920 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[26758] It is appreciated that GAM1920 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1920 target genes. The mRNA of each one of this plurality of GAM1920 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1920 RNA, herein designated GAM RNA, and which when bound by GAM1920 RNA, herein designated GAM RNA,

causes inhibition of translation of respective one or more GAM1920 target proteins.

[26759] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1920 gene, herein designated GAM GENE, on one or more GAM1920 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[26760] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1920 correlate with, and may be deduced from, the identity of the target genes which GAM1920 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[26761] Nucleotide sequences of the GAM1920 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1920 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1920 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1920 are further described hereinbelow with reference to Table 1.

[26762] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1920 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[26763] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1921 (GAM1921) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[26764] GAM1921 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1921 was detected is described hereinabove with reference to Figs. 2-8.

[26765] GAM1921 gene, herein designated GAM GENE, and GAM1921 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[26766] GAM1921 gene, herein designated GAM GENE, encodes a GAM1921 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1921 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1921 precursor RNA is designated SEQ ID:1898, and is provided hereinbelow with reference to the sequence listing part.

[26767] GAM1921 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1921 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[26768] An enzyme complex designated DICER COMPLEX, dices the GAM1921 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1921 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 80%) nucleotide sequence of GAM1921 RNA is designated SEQ ID:4506, and is provided hereinbelow with reference to the sequence listing part.

[26769] GAM1921 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1921 target RNA, herein designated GAM TARGET RNA. GAM1921 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[26770] GAM1921 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1921 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1921 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1921 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1921 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[26771] The complementary binding of GAM1921 RNA, herein designated GAM RNA, to target binding sites on GAM1921 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1921 target RNA, herein designated GAM TARGET RNA, into GAM1921 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[26772] It is appreciated that GAM1921 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1921 target genes. The

mRNA of each one of this plurality of GAM1921 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1921 RNA, herein designated GAM RNA, and which when bound by GAM1921 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1921 target proteins.

[26773] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1921 gene, herein designated GAM GENE, on one or more GAM1921 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[26774] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1921 correlate with, and may be deduced from, the identity of the target genes which GAM1921 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[26775] Nucleotide sequences of the GAM1921 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1921 RNA, herein

designated GAM RNA, and a schematic representation of the secondary folding of GAM1921 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1921 are further described hereinbelow with reference to Table 1.

[26776] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1921 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[26777] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1922 (GAM1922) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[26778] GAM1922 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1922 was detected is described hereinabove with reference to Figs. 2-8.

[26779] GAM1922 gene, herein designated GAM GENE, and GAM1922 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[26780] GAM1922 gene, herein designated GAM GENE, encodes a GAM1922 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1922 precursor RNA,

herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1922 precursor RNA is designated SEQ ID:1899, and is provided hereinbelow with reference to the sequence listing part.

[26781] GAM1922 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1922 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[26782] An enzyme complex designated DICER COMPLEX, dices the GAM1922 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1922 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 76%) nucleotide sequence of GAM1922 RNA is designated SEQ ID:4508, and is provided hereinbelow with reference to the sequence listing part.

[26783] GAM1922 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1922 target RNA, herein designated GAM TARGET RNA. GAM1922 target RNA, herein designated GAM

TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[26784] GAM1922 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1922 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1922 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1922 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1922 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[26785] The complementary binding of GAM1922 RNA, herein designated GAM RNA, to target binding sites on GAM1922 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1922 target RNA, herein designated GAM TARGET RNA, into GAM1922 target protein, herein

designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[26786] It is appreciated that GAM1922 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1922 target genes. The mRNA of each one of this plurality of GAM1922 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1922 RNA, herein designated GAM RNA, and which when bound by GAM1922 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1922 target proteins.

[26787] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1922 gene, herein designated GAM GENE, on one or more GAM1922 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[26788] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1922 correlate with, and may be deduced from, the identity of the target

genes which GAM1922 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[26789] Nucleotide sequences of the GAM1922 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1922 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1922 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1922 are further described hereinbelow with reference to Table 1.

[26790] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1922 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[26791] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1923 (GAM1923) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[26792] GAM1923 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1923 was detected is described hereinabove with reference to Figs. 2-8.

[26793] GAM1923 gene, herein designated GAM GENE, and GAM1923 target gene, herein designated GAM TARGET GENE, are human genes contained in the

human genome.

[26794] GAM1923 gene, herein designated GAM GENE, encodes a GAM1923 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1923 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1923 precursor RNA is designated SEQ ID:1900, and is provided hereinbelow with reference to the sequence listing part.

[26795] GAM1923 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1923 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[26796] An enzyme complex designated DICER COMPLEX, dices the GAM1923 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1923 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM1923 RNA is designated SEQ ID:4507, and is provided

hereinbelow with reference to the sequence listing part.

[26797] GAM1923 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1923 target RNA, herein designated GAM TARGET RNA. GAM1923 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[26798] GAM1923 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1923 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1923 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1923 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1923 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[26799] The complementary binding of GAM1923 RNA, herein designated GAM RNA, to target binding sites on GAM1923 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1923 target RNA, herein designated GAM TARGET RNA, into GAM1923 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[26800] It is appreciated that GAM1923 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1923 target genes. The mRNA of each one of this plurality of GAM1923 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1923 RNA, herein designated GAM RNA, and which when bound by GAM1923 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1923 target proteins.

[26801] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1923 gene, herein designated GAM GENE, on one or more GAM1923 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding

sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[26802] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1923 correlate with, and may be deduced from, the identity of the target genes which GAM1923 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[26803] Nucleotide sequences of the GAM1923 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1923 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1923 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1923 are further described hereinbelow with reference to Table 1.

[26804] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1923 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[26805] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1924 (GAM1924) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[26806] GAM1924 is a novel bioinformatically detected regulatory, non protein

coding, micro RNA (miRNA) gene. The method by which GAM1924 was detected is described hereinabove with reference to Figs. 2-8.

[26807] GAM1924 gene, herein designated GAM GENE, and GAM1924 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[26808] GAM1924 gene, herein designated GAM GENE, encodes a GAM1924 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1924 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1924 precursor RNA is designated SEQ ID:1901, and is provided hereinbelow with reference to the sequence listing part.

[26809] GAM1924 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1924 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[26810] An enzyme complex designated DICER COMPLEX, dices the GAM1924 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1924 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin

structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM1924 RNA is designated SEQ ID:4509, and is provided hereinbelow with reference to the sequence listing part.

[26811] GAM1924 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1924 target RNA, herein designated GAM TARGET RNA. GAM1924 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[26812] GAM1924 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1924 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1924 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1924 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1924 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target

binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[26813] The complementary binding of GAM1924 RNA, herein designated GAM RNA, to target binding sites on GAM1924 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1924 target RNA, herein designated GAM TARGET RNA, into GAM1924 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[26814] It is appreciated that GAM1924 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1924 target genes. The mRNA of each one of this plurality of GAM1924 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1924 RNA, herein designated GAM RNA, and which when bound by GAM1924 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1924 target proteins.

[26815] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1924 gene, herein designated GAM GENE, on one or more GAM1924 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary

binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[26816] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1924 correlate with, and may be deduced from, the identity of the target genes which GAM1924 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[26817] Nucleotide sequences of the GAM1924 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1924 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1924 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1924 are further described hereinbelow with reference to Table 1.

[26818] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1924 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[26819] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1925 (GAM1925) gene, which modulates

expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[26820] GAM1925 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1925 was detected is described hereinabove with reference to Figs. 2-8.

[26821] GAM1925 gene, herein designated GAM GENE, and GAM1925 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[26822] GAM1925 gene, herein designated GAM GENE, encodes a GAM1925 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1925 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1925 precursor RNA is designated SEQ ID:1902, and is provided hereinbelow with reference to the sequence listing part.

[26823] GAM1925 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1925 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[26824] An enzyme complex designated DICER COMPLEX, dices the GAM1925 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1925 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 85%) nucleotide sequence of GAM1925 RNA is designated SEQ ID:4510, and is provided hereinbelow with reference to the sequence listing part.

[26825] GAM1925 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1925 target RNA, herein designated GAM TARGET RNA. GAM1925 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[26826] GAM1925 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1925 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1925 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an

illustration only, and is not meant to be limiting GAM1925 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1925 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[26827] The complementary binding of GAM1925 RNA, herein designated GAM RNA, to target binding sites on GAM1925 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1925 target RNA, herein designated GAM TARGET RNA, into GAM1925 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[26828] It is appreciated that GAM1925 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1925 target genes. The mRNA of each one of this plurality of GAM1925 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1925 RNA, herein designated GAM RNA, and which when bound by GAM1925 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1925 target proteins.

[26829] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition

exerted by GAM1925 gene, herein designated GAM GENE, on one or more GAM1925 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[26830] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1925 correlate with, and may be deduced from, the identity of the target genes which GAM1925 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[26831] Nucleotide sequences of the GAM1925 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1925 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1925 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1925 are further described hereinbelow with reference to Table 1.

[26832] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1925 RNA, herein designated GAM RNA, are described hereinbelow

with reference to Table 2.

[26833] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1926 (GAM1926) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[26834] GAM1926 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1926 was detected is described hereinabove with reference to Figs. 2-8.

[26835] GAM1926 gene, herein designated GAM GENE, and GAM1926 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[26836] GAM1926 gene, herein designated GAM GENE, encodes a GAM1926 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1926 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1926 precursor RNA is designated SEQ ID:1903, and is provided hereinbelow with reference to the sequence listing part.

[26837] GAM1926 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1926 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA

encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[26838] An enzyme complex designated DICER COMPLEX, dices the GAM1926 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1926 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 78%) nucleotide sequence of GAM1926 RNA is designated SEQ ID:4511, and is provided hereinbelow with reference to the sequence listing part.

[26839] GAM1926 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1926 target RNA, herein designated GAM TARGET RNA. GAM1926 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[26840] GAM1926 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1926 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1926 RNA,

herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1926 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1926 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[26841] The complementary binding of GAM1926 RNA, herein designated GAM RNA, to target binding sites on GAM1926 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1926 target RNA, herein designated GAM TARGET RNA, into GAM1926 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[26842] It is appreciated that GAM1926 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1926 target genes. The mRNA of each one of this plurality of GAM1926 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1926 RNA, herein designated GAM RNA, and which when bound by GAM1926 RNA, herein designated GAM RNA,

causes inhibition of translation of respective one or more GAM1926 target proteins.

[26843] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1926 gene, herein designated GAM GENE, on one or more GAM1926 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[26844] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1926 correlate with, and may be deduced from, the identity of the target genes which GAM1926 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[26845] Nucleotide sequences of the GAM1926 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1926 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1926 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1926 are further described hereinbelow with reference to Table 1.

[26846] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1926 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[26847] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1927 (GAM1927) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[26848] GAM1927 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1927 was detected is described hereinabove with reference to Figs. 2-8.

[26849] GAM1927 gene, herein designated GAM GENE, and GAM1927 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[26850] GAM1927 gene, herein designated GAM GENE, encodes a GAM1927 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1927 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1927 precursor RNA is designated SEQ ID:1904, and is provided hereinbelow with reference to the sequence listing part.

[26851] GAM1927 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1927 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[26852] An enzyme complex designated DICER COMPLEX, dices the GAM1927 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1927 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM1927 RNA is designated SEQ ID:4512, and is provided hereinbelow with reference to the sequence listing part.

[26853] GAM1927 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1927 target RNA, herein designated GAM TARGET RNA. GAM1927 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[26854] GAM1927 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1927 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1927 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1927 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1927 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[26855] The complementary binding of GAM1927 RNA, herein designated GAM RNA, to target binding sites on GAM1927 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1927 target RNA, herein designated GAM TARGET RNA, into GAM1927 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[26856] It is appreciated that GAM1927 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1927 target genes. The

mRNA of each one of this plurality of GAM1927 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1927 RNA, herein designated GAM RNA, and which when bound by GAM1927 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1927 target proteins.

[26857] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1927 gene, herein designated GAM GENE, on one or more GAM1927 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[26858] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1927 correlate with, and may be deduced from, the identity of the target genes which GAM1927 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[26859] Nucleotide sequences of the GAM1927 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1927 RNA, herein

designated GAM RNA, and a schematic representation of the secondary folding of GAM1927 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1927 are further described hereinbelow with reference to Table 1.

[26860] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1927 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[26861] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1928 (GAM1928) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[26862] GAM1928 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1928 was detected is described hereinabove with reference to Figs. 2-8.

[26863] GAM1928 gene, herein designated GAM GENE, and GAM1928 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[26864] GAM1928 gene, herein designated GAM GENE, encodes a GAM1928 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1928 precursor RNA,

herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1928 precursor RNA is designated SEQ ID:1905, and is provided hereinbelow with reference to the sequence listing part.

[26865] GAM1928 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1928 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[26866] An enzyme complex designated DICER COMPLEX, dices the GAM1928 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1928 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 79%) nucleotide sequence of GAM1928 RNA is designated SEQ ID:4513, and is provided hereinbelow with reference to the sequence listing part.

[26867] GAM1928 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1928 target RNA, herein designated GAM TARGET RNA. GAM1928 target RNA, herein designated GAM

TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[26868] GAM1928 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1928 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1928 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1928 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1928 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[26869] The complementary binding of GAM1928 RNA, herein designated GAM RNA, to target binding sites on GAM1928 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1928 target RNA, herein designated GAM TARGET RNA, into GAM1928 target protein, herein

designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[26870] It is appreciated that GAM1928 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1928 target genes. The mRNA of each one of this plurality of GAM1928 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1928 RNA, herein designated GAM RNA, and which when bound by GAM1928 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1928 target proteins.

[26871] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1928 gene, herein designated GAM GENE, on one or more GAM1928 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[26872] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1928 correlate with, and may be deduced from, the identity of the target

genes which GAM1928 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[26873] Nucleotide sequences of the GAM1928 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1928 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1928 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1928 are further described hereinbelow with reference to Table 1.

[26874] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1928 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[26875] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1929 (GAM1929) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[26876] GAM1929 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1929 was detected is described hereinabove with reference to Figs. 2-8.

[26877] GAM1929 gene, herein designated GAM GENE, and GAM1929 target gene, herein designated GAM TARGET GENE, are human genes contained in the

human genome.

[26878] GAM1929 gene, herein designated GAM GENE, encodes a GAM1929 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1929 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1929 precursor RNA is designated SEQ ID:1906, and is provided hereinbelow with reference to the sequence listing part.

[26879] GAM1929 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1929 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[26880] An enzyme complex designated DICER COMPLEX, dices the GAM1929 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1929 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 87%) nucleotide sequence of GAM1929 RNA is designated SEQ ID:4514, and is provided

hereinbelow with reference to the sequence listing part.

[26881] GAM1929 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1929 target RNA, herein designated GAM TARGET RNA. GAM1929 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[26882] GAM1929 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1929 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1929 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1929 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1929 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[26883] The complementary binding of GAM1929 RNA, herein designated GAM RNA, to target binding sites on GAM1929 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1929 target RNA, herein designated GAM TARGET RNA, into GAM1929 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[26884] It is appreciated that GAM1929 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1929 target genes. The mRNA of each one of this plurality of GAM1929 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1929 RNA, herein designated GAM RNA, and which when bound by GAM1929 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1929 target proteins.

[26885] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1929 gene, herein designated GAM GENE, on one or more GAM1929 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding

sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[26886] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1929 correlate with, and may be deduced from, the identity of the target genes which GAM1929 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[26887] Nucleotide sequences of the GAM1929 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1929 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1929 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1929 are further described hereinbelow with reference to Table 1.

[26888] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1929 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[26889] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1930 (GAM1930) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[26890] GAM1930 is a novel bioinformatically detected regulatory, non protein

coding, micro RNA (miRNA) gene. The method by which GAM1930 was detected is described hereinabove with reference to Figs. 2-8.

[26891] GAM1930 gene, herein designated GAM GENE, and GAM1930 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[26892] GAM1930 gene, herein designated GAM GENE, encodes a GAM1930 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1930 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1930 precursor RNA is designated SEQ ID:1907, and is provided hereinbelow with reference to the sequence listing part.

[26893] GAM1930 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1930 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[26894] An enzyme complex designated DICER COMPLEX, dices the GAM1930 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1930 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin

structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 79%) nucleotide sequence of GAM1930 RNA is designated SEQ ID:4515, and is provided hereinbelow with reference to the sequence listing part.

[26895] GAM1930 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1930 target RNA, herein designated GAM TARGET RNA. GAM1930 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[26896] GAM1930 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1930 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1930 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1930 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1930 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target

binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[26897] The complementary binding of GAM1930 RNA, herein designated GAM RNA, to target binding sites on GAM1930 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1930 target RNA, herein designated GAM TARGET RNA, into GAM1930 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[26898] It is appreciated that GAM1930 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1930 target genes. The mRNA of each one of this plurality of GAM1930 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1930 RNA, herein designated GAM RNA, and which when bound by GAM1930 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1930 target proteins.

[26899] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1930 gene, herein designated GAM GENE, on one or more GAM1930 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary

binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[26900] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1930 correlate with, and may be deduced from, the identity of the target genes which GAM1930 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[26901] Nucleotide sequences of the GAM1930 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1930 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1930 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1930 are further described hereinbelow with reference to Table 1.

[26902] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1930 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[26903] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1931 (GAM1931) gene, which modulates

expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[26904] GAM1931 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1931 was detected is described hereinabove with reference to Figs. 2-8.

[26905] GAM1931 gene, herein designated GAM GENE, and GAM1931 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[26906] GAM1931 gene, herein designated GAM GENE, encodes a GAM1931 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1931 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1931 precursor RNA is designated SEQ ID:1908, and is provided hereinbelow with reference to the sequence listing part.

[26907] GAM1931 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1931 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[26908] An enzyme complex designated DICER COMPLEX, dices the GAM1931 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1931 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 84%) nucleotide sequence of GAM1931 RNA is designated SEQ ID:4516, and is provided hereinbelow with reference to the sequence listing part.

[26909] GAM1931 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1931 target RNA, herein designated GAM TARGET RNA. GAM1931 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[26910] GAM1931 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1931 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1931 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an

illustration only, and is not meant to be limiting GAM1931 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1931 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[26911] The complementary binding of GAM1931 RNA, herein designated GAM RNA, to target binding sites on GAM1931 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1931 target RNA, herein designated GAM TARGET RNA, into GAM1931 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[26912] It is appreciated that GAM1931 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1931 target genes. The mRNA of each one of this plurality of GAM1931 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1931 RNA, herein designated GAM RNA, and which when bound by GAM1931 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1931 target proteins.

[26913] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition

exerted by GAM1931 gene, herein designated GAM GENE, on one or more GAM1931 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[26914] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1931 correlate with, and may be deduced from, the identity of the target genes which GAM1931 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[26915] Nucleotide sequences of the GAM1931 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1931 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1931 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1931 are further described hereinbelow with reference to Table 1.

[26916] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1931 RNA, herein designated GAM RNA, are described hereinbelow

with reference to Table 2.

[26917] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1932 (GAM1932) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[26918] GAM1932 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1932 was detected is described hereinabove with reference to Figs. 2-8.

[26919] GAM1932 gene, herein designated GAM GENE, and GAM1932 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[26920] GAM1932 gene, herein designated GAM GENE, encodes a GAM1932 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1932 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1932 precursor RNA is designated SEQ ID:1909, and is provided hereinbelow with reference to the sequence listing part.

[26921] GAM1932 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1932 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA

encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[26922] An enzyme complex designated DICER COMPLEX, dices the GAM1932 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1932 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 87%) nucleotide sequence of GAM1932 RNA is designated SEQ ID:4517, and is provided hereinbelow with reference to the sequence listing part.

[26923] GAM1932 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1932 target RNA, herein designated GAM TARGET RNA. GAM1932 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[26924] GAM1932 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1932 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1932 RNA,

herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1932 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1932 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[26925] The complementary binding of GAM1932 RNA, herein designated GAM RNA, to target binding sites on GAM1932 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1932 target RNA, herein designated GAM TARGET RNA, into GAM1932 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[26926] It is appreciated that GAM1932 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1932 target genes. The mRNA of each one of this plurality of GAM1932 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1932 RNA, herein designated GAM RNA, and which when bound by GAM1932 RNA, herein designated GAM RNA,

causes inhibition of translation of respective one or more GAM1932 target proteins.

[26927] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1932 gene, herein designated GAM GENE, on one or more GAM1932 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[26928] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1932 correlate with, and may be deduced from, the identity of the target genes which GAM1932 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[26929] Nucleotide sequences of the GAM1932 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1932 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1932 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1932 are further described hereinbelow with reference to Table 1.

[26930] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1932 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[26931] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1933 (GAM1933) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[26932] GAM1933 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1933 was detected is described hereinabove with reference to Figs. 2-8.

[26933] GAM1933 gene, herein designated GAM GENE, and GAM1933 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[26934] GAM1933 gene, herein designated GAM GENE, encodes a GAM1933 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1933 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1933 precursor RNA is designated SEQ ID:1910, and is provided hereinbelow with reference to the sequence listing part.

[26935] GAM1933 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1933 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[26936] An enzyme complex designated DICER COMPLEX, dices the GAM1933 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1933 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 84%) nucleotide sequence of GAM1933 RNA is designated SEQ ID:4518, and is provided hereinbelow with reference to the sequence listing part.

[26937] GAM1933 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1933 target RNA, herein designated GAM TARGET RNA. GAM1933 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[26938] GAM1933 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1933 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1933 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1933 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1933 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[26939] The complementary binding of GAM1933 RNA, herein designated GAM RNA, to target binding sites on GAM1933 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1933 target RNA, herein designated GAM TARGET RNA, into GAM1933 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[26940] It is appreciated that GAM1933 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1933 target genes. The

mRNA of each one of this plurality of GAM1933 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1933 RNA, herein designated GAM RNA, and which when bound by GAM1933 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1933 target proteins.

[26941] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1933 gene, herein designated GAM GENE, on one or more GAM1933 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[26942] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1933 correlate with, and may be deduced from, the identity of the target genes which GAM1933 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[26943] Nucleotide sequences of the GAM1933 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1933 RNA, herein

designated GAM RNA, and a schematic representation of the secondary folding of GAM1933 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1933 are further described hereinbelow with reference to Table 1.

[26944] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1933 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[26945] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1934 (GAM1934) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[26946] GAM1934 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1934 was detected is described hereinabove with reference to Figs. 2-8.

[26947] GAM1934 gene, herein designated GAM GENE, and GAM1934 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[26948] GAM1934 gene, herein designated GAM GENE, encodes a GAM1934 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1934 precursor RNA,

herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1934 precursor RNA is designated SEQ ID:1911, and is provided hereinbelow with reference to the sequence listing part.

[26949] GAM1934 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1934 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[26950] An enzyme complex designated DICER COMPLEX, dices the GAM1934 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1934 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 78%) nucleotide sequence of GAM1934 RNA is designated SEQ ID:4519, and is provided hereinbelow with reference to the sequence listing part.

[26951] GAM1934 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1934 target RNA, herein designated GAM TARGET RNA. GAM1934 target RNA, herein designated GAM

TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[26952] GAM1934 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1934 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1934 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1934 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1934 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[26953] The complementary binding of GAM1934 RNA, herein designated GAM RNA, to target binding sites on GAM1934 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1934 target RNA, herein designated GAM TARGET RNA, into GAM1934 target protein, herein

designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[26954] It is appreciated that GAM1934 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1934 target genes. The mRNA of each one of this plurality of GAM1934 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1934 RNA, herein designated GAM RNA, and which when bound by GAM1934 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1934 target proteins.

[26955] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1934 gene, herein designated GAM GENE, on one or more GAM1934 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[26956] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1934 correlate with, and may be deduced from, the identity of the target

genes which GAM1934 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[26957] Nucleotide sequences of the GAM1934 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1934 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1934 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1934 are further described hereinbelow with reference to Table 1.

[26958] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1934 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[26959] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1935 (GAM1935) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[26960] GAM1935 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1935 was detected is described hereinabove with reference to Figs. 2-8.

[26961] GAM1935 gene, herein designated GAM GENE, and GAM1935 target gene, herein designated GAM TARGET GENE, are human genes contained in the

human genome.

[26962] GAM1935 gene, herein designated GAM GENE, encodes a GAM1935 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1935 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1935 precursor RNA is designated SEQ ID:1912, and is provided hereinbelow with reference to the sequence listing part.

[26963] GAM1935 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1935 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[26964] An enzyme complex designated DICER COMPLEX, dices the GAM1935 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1935 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 79%) nucleotide sequence of GAM1935 RNA is designated SEQ ID:4520, and is provided

hereinbelow with reference to the sequence listing part.

[26965] GAM1935 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1935 target RNA, herein designated GAM TARGET RNA. GAM1935 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[26966] GAM1935 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1935 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1935 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1935 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1935 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[26967] The complementary binding of GAM1935 RNA, herein designated GAM RNA, to target binding sites on GAM1935 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1935 target RNA, herein designated GAM TARGET RNA, into GAM1935 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[26968] It is appreciated that GAM1935 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1935 target genes. The mRNA of each one of this plurality of GAM1935 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1935 RNA, herein designated GAM RNA, and which when bound by GAM1935 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1935 target proteins.

[26969] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1935 gene, herein designated GAM GENE, on one or more GAM1935 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding

sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[26970] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1935 correlate with, and may be deduced from, the identity of the target genes which GAM1935 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[26971] Nucleotide sequences of the GAM1935 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1935 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1935 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1935 are further described hereinbelow with reference to Table 1.

[26972] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1935 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[26973] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1936 (GAM1936) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[26974] GAM1936 is a novel bioinformatically detected regulatory, non protein

coding, micro RNA (miRNA) gene. The method by which GAM1936 was detected is described hereinabove with reference to Figs. 2-8.

[26975] GAM1936 gene, herein designated GAM GENE, and GAM1936 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[26976] GAM1936 gene, herein designated GAM GENE, encodes a GAM1936 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1936 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1936 precursor RNA is designated SEQ ID:1913, and is provided hereinbelow with reference to the sequence listing part.

[26977] GAM1936 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1936 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[26978] An enzyme complex designated DICER COMPLEX, dices the GAM1936 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1936 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin

structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 82%) nucleotide sequence of GAM1936 RNA is designated SEQ ID:4521, and is provided hereinbelow with reference to the sequence listing part.

[26979] GAM1936 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1936 target RNA, herein designated GAM TARGET RNA. GAM1936 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[26980] GAM1936 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1936 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1936 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1936 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1936 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target

binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[26981] The complementary binding of GAM1936 RNA, herein designated GAM RNA, to target binding sites on GAM1936 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1936 target RNA, herein designated GAM TARGET RNA, into GAM1936 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[26982] It is appreciated that GAM1936 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1936 target genes. The mRNA of each one of this plurality of GAM1936 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1936 RNA, herein designated GAM RNA, and which when bound by GAM1936 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1936 target proteins.

[26983] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1936 gene, herein designated GAM GENE, on one or more GAM1936 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary

binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[26984] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1936 correlate with, and may be deduced from, the identity of the target genes which GAM1936 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[26985] Nucleotide sequences of the GAM1936 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1936 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1936 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1936 are further described hereinbelow with reference to Table 1.

[26986] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1936 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[26987] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1937 (GAM1937) gene, which modulates

expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[26988] GAM1937 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1937 was detected is described hereinabove with reference to Figs. 2-8.

[26989] GAM1937 gene, herein designated GAM GENE, and GAM1937 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[26990] GAM1937 gene, herein designated GAM GENE, encodes a GAM1937 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1937 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1937 precursor RNA is designated SEQ ID:1914, and is provided hereinbelow with reference to the sequence listing part.

[26991] GAM1937 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1937 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[26992] An enzyme complex designated DICER COMPLEX, dices the GAM1937 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1937 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 87%) nucleotide sequence of GAM1937 RNA is designated SEQ ID:4522, and is provided hereinbelow with reference to the sequence listing part.

[26993] GAM1937 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1937 target RNA, herein designated GAM TARGET RNA. GAM1937 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[26994] GAM1937 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1937 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1937 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an

illustration only, and is not meant to be limiting GAM1937 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1937 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[26995] The complementary binding of GAM1937 RNA, herein designated GAM RNA, to target binding sites on GAM1937 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1937 target RNA, herein designated GAM TARGET RNA, into GAM1937 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[26996] It is appreciated that GAM1937 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1937 target genes. The mRNA of each one of this plurality of GAM1937 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1937 RNA, herein designated GAM RNA, and which when bound by GAM1937 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1937 target proteins.

[26997] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition

exerted by GAM1937 gene, herein designated GAM GENE, on one or more GAM1937 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[26998] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1937 correlate with, and may be deduced from, the identity of the target genes which GAM1937 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[26999] Nucleotide sequences of the GAM1937 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1937 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1937 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1937 are further described hereinbelow with reference to Table 1.

[27000] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1937 RNA, herein designated GAM RNA, are described hereinbelow

with reference to Table 2.

[27001] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1938 (GAM1938) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[27002] GAM1938 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1938 was detected is described hereinabove with reference to Figs. 2-8.

[27003] GAM1938 gene, herein designated GAM GENE, and GAM1938 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[27004] GAM1938 gene, herein designated GAM GENE, encodes a GAM1938 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1938 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1938 precursor RNA is designated SEQ ID:1915, and is provided hereinbelow with reference to the sequence listing part.

[27005] GAM1938 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1938 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA

encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[27006] An enzyme complex designated DICER COMPLEX, dices the GAM1938 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1938 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 82%) nucleotide sequence of GAM1938 RNA is designated SEQ ID:4523, and is provided hereinbelow with reference to the sequence listing part.

[27007] GAM1938 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1938 target RNA, herein designated GAM TARGET RNA. GAM1938 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[27008] GAM1938 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1938 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1938 RNA,

herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1938 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1938 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[27009] The complementary binding of GAM1938 RNA, herein designated GAM RNA, to target binding sites on GAM1938 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1938 target RNA, herein designated GAM TARGET RNA, into GAM1938 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[27010] It is appreciated that GAM1938 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1938 target genes. The mRNA of each one of this plurality of GAM1938 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1938 RNA, herein designated GAM RNA, and which when bound by GAM1938 RNA, herein designated GAM RNA,

causes inhibition of translation of respective one or more GAM1938 target proteins.

[27011] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1938 gene, herein designated GAM GENE, on one or more GAM1938 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[27012] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1938 correlate with, and may be deduced from, the identity of the target genes which GAM1938 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[27013] Nucleotide sequences of the GAM1938 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1938 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1938 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1938 are further described hereinbelow with reference to Table 1.

[27014] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1938 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[27015] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1939 (GAM1939) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[27016] GAM1939 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1939 was detected is described hereinabove with reference to Figs. 2-8.

[27017] GAM1939 gene, herein designated GAM GENE, and GAM1939 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[27018] GAM1939 gene, herein designated GAM GENE, encodes a GAM1939 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1939 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1939 precursor RNA is designated SEQ ID:1916, and is provided hereinbelow with reference to the sequence listing part.

[27019] GAM1939 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1939 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[27020] An enzyme complex designated DICER COMPLEX, dices the GAM1939 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1939 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 76%) nucleotide sequence of GAM1939 RNA is designated SEQ ID:4524, and is provided hereinbelow with reference to the sequence listing part.

[27021] GAM1939 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1939 target RNA, herein designated GAM TARGET RNA. GAM1939 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[27022] GAM1939 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1939 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1939 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1939 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1939 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[27023] The complementary binding of GAM1939 RNA, herein designated GAM RNA, to target binding sites on GAM1939 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1939 target RNA, herein designated GAM TARGET RNA, into GAM1939 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[27024] It is appreciated that GAM1939 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1939 target genes. The

mRNA of each one of this plurality of GAM1939 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1939 RNA, herein designated GAM RNA, and which when bound by GAM1939 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1939 target proteins.

[27025] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1939 gene, herein designated GAM GENE, on one or more GAM1939 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[27026] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1939 correlate with, and may be deduced from, the identity of the target genes which GAM1939 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[27027] Nucleotide sequences of the GAM1939 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1939 RNA, herein

designated GAM RNA, and a schematic representation of the secondary folding of GAM1939 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1939 are further described hereinbelow with reference to Table 1.

[27028] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1939 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[27029] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1940 (GAM1940) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[27030] GAM1940 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1940 was detected is described hereinabove with reference to Figs. 2-8.

[27031] GAM1940 gene, herein designated GAM GENE, and GAM1940 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[27032] GAM1940 gene, herein designated GAM GENE, encodes a GAM1940 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1940 precursor RNA,

herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1940 precursor RNA is designated SEQ ID:1917, and is provided hereinbelow with reference to the sequence listing part.

[27033] GAM1940 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1940 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[27034] An enzyme complex designated DICER COMPLEX, dices the GAM1940 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1940 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 76%) nucleotide sequence of GAM1940 RNA is designated SEQ ID:4526, and is provided hereinbelow with reference to the sequence listing part.

[27035] GAM1940 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1940 target RNA, herein designated GAM TARGET RNA. GAM1940 target RNA, herein designated GAM

TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[27036] GAM1940 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1940 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1940 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1940 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1940 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[27037] The complementary binding of GAM1940 RNA, herein designated GAM RNA, to target binding sites on GAM1940 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1940 target RNA, herein designated GAM TARGET RNA, into GAM1940 target protein, herein

designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[27038] It is appreciated that GAM1940 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1940 target genes. The mRNA of each one of this plurality of GAM1940 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1940 RNA, herein designated GAM RNA, and which when bound by GAM1940 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1940 target proteins.

[27039] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1940 gene, herein designated GAM GENE, on one or more GAM1940 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[27040] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1940 correlate with, and may be deduced from, the identity of the target

genes which GAM1940 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[27041] Nucleotide sequences of the GAM1940 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1940 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1940 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1940 are further described hereinbelow with reference to Table 1.

[27042] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1940 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[27043] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1941 (GAM1941) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[27044] GAM1941 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1941 was detected is described hereinabove with reference to Figs. 2-8.

[27045] GAM1941 gene, herein designated GAM GENE, and GAM1941 target gene, herein designated GAM TARGET GENE, are human genes contained in the

human genome.

[27046] GAM1941 gene, herein designated GAM GENE, encodes a GAM1941 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1941 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1941 precursor RNA is designated SEQ ID:1918, and is provided hereinbelow with reference to the sequence listing part.

[27047] GAM1941 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1941 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[27048] An enzyme complex designated DICER COMPLEX, dices the GAM1941 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1941 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 83%) nucleotide sequence of GAM1941 RNA is designated SEQ ID:4525, and is provided

hereinbelow with reference to the sequence listing part.

[27049] GAM1941 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1941 target RNA, herein designated GAM TARGET RNA. GAM1941 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[27050] GAM1941 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1941 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1941 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1941 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1941 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[27051] The complementary binding of GAM1941 RNA, herein designated GAM RNA, to target binding sites on GAM1941 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1941 target RNA, herein designated GAM TARGET RNA, into GAM1941 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[27052] It is appreciated that GAM1941 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1941 target genes. The mRNA of each one of this plurality of GAM1941 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1941 RNA, herein designated GAM RNA, and which when bound by GAM1941 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1941 target proteins.

[27053] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1941 gene, herein designated GAM GENE, on one or more GAM1941 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding

sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[27054] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1941 correlate with, and may be deduced from, the identity of the target genes which GAM1941 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[27055] Nucleotide sequences of the GAM1941 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1941 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1941 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1941 are further described hereinbelow with reference to Table 1.

[27056] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1941 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[27057] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1942 (GAM1942) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[27058] GAM1942 is a novel bioinformatically detected regulatory, non protein

coding, micro RNA (miRNA) gene. The method by which GAM1942 was detected is described hereinabove with reference to Figs. 2-8.

[27059] GAM1942 gene, herein designated GAM GENE, and GAM1942 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[27060] GAM1942 gene, herein designated GAM GENE, encodes a GAM1942 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1942 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1942 precursor RNA is designated SEQ ID:1919, and is provided hereinbelow with reference to the sequence listing part.

[27061] GAM1942 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1942 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[27062] An enzyme complex designated DICER COMPLEX, dices the GAM1942 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1942 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin

structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 83%) nucleotide sequence of GAM1942 RNA is designated SEQ ID:4527, and is provided hereinbelow with reference to the sequence listing part.

[27063] GAM1942 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1942 target RNA, herein designated GAM TARGET RNA. GAM1942 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[27064] GAM1942 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1942 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1942 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1942 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1942 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target

binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[27065] The complementary binding of GAM1942 RNA, herein designated GAM RNA, to target binding sites on GAM1942 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1942 target RNA, herein designated GAM TARGET RNA, into GAM1942 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[27066] It is appreciated that GAM1942 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1942 target genes. The mRNA of each one of this plurality of GAM1942 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1942 RNA, herein designated GAM RNA, and which when bound by GAM1942 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1942 target proteins.

[27067] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1942 gene, herein designated GAM GENE, on one or more GAM1942 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary

binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[27068] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1942 correlate with, and may be deduced from, the identity of the target genes which GAM1942 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[27069] Nucleotide sequences of the GAM1942 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1942 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1942 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1942 are further described hereinbelow with reference to Table 1.

[27070] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1942 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[27071] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1943 (GAM1943) gene, which modulates

expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[27072] GAM1943 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1943 was detected is described hereinabove with reference to Figs. 2-8.

[27073] GAM1943 gene, herein designated GAM GENE, and GAM1943 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[27074] GAM1943 gene, herein designated GAM GENE, encodes a GAM1943 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1943 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1943 precursor RNA is designated SEQ ID:1920, and is provided hereinbelow with reference to the sequence listing part.

[27075] GAM1943 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1943 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[27076] An enzyme complex designated DICER COMPLEX, dices the GAM1943 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1943 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM1943 RNA is designated SEQ ID:4528, and is provided hereinbelow with reference to the sequence listing part.

[27077] GAM1943 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1943 target RNA, herein designated GAM TARGET RNA. GAM1943 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[27078] GAM1943 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1943 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1943 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an

illustration only, and is not meant to be limiting GAM1943 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1943 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[27079] The complementary binding of GAM1943 RNA, herein designated GAM RNA, to target binding sites on GAM1943 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1943 target RNA, herein designated GAM TARGET RNA, into GAM1943 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[27080] It is appreciated that GAM1943 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1943 target genes. The mRNA of each one of this plurality of GAM1943 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1943 RNA, herein designated GAM RNA, and which when bound by GAM1943 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1943 target proteins.

[27081] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition

exerted by GAM1943 gene, herein designated GAM GENE, on one or more GAM1943 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[27082] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1943 correlate with, and may be deduced from, the identity of the target genes which GAM1943 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[27083] Nucleotide sequences of the GAM1943 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1943 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1943 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1943 are further described hereinbelow with reference to Table 1.

[27084] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1943 RNA, herein designated GAM RNA, are described hereinbelow

with reference to Table 2.

[27085] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1944 (GAM1944) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[27086] GAM1944 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1944 was detected is described hereinabove with reference to Figs. 2-8.

[27087] GAM1944 gene, herein designated GAM GENE, and GAM1944 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[27088] GAM1944 gene, herein designated GAM GENE, encodes a GAM1944 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1944 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1944 precursor RNA is designated SEQ ID:1921, and is provided hereinbelow with reference to the sequence listing part.

[27089] GAM1944 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1944 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA

encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[27090] An enzyme complex designated DICER COMPLEX, dices the GAM1944 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1944 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 89%) nucleotide sequence of GAM1944 RNA is designated SEQ ID:4529, and is provided hereinbelow with reference to the sequence listing part.

[27091] GAM1944 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1944 target RNA, herein designated GAM TARGET RNA. GAM1944 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[27092] GAM1944 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1944 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1944 RNA,

herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1944 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1944 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[27093] The complementary binding of GAM1944 RNA, herein designated GAM RNA, to target binding sites on GAM1944 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1944 target RNA, herein designated GAM TARGET RNA, into GAM1944 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[27094] It is appreciated that GAM1944 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1944 target genes. The mRNA of each one of this plurality of GAM1944 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1944 RNA, herein designated GAM RNA, and which when bound by GAM1944 RNA, herein designated GAM RNA,

causes inhibition of translation of respective one or more GAM1944 target proteins.

[27095] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1944 gene, herein designated GAM GENE, on one or more GAM1944 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[27096] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1944 correlate with, and may be deduced from, the identity of the target genes which GAM1944 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[27097] Nucleotide sequences of the GAM1944 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1944 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1944 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1944 are further described hereinbelow with reference to Table 1.

[27098] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1944 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[27099] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1945 (GAM1945) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[27100] GAM1945 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1945 was detected is described hereinabove with reference to Figs. 2-8.

[27101] GAM1945 gene, herein designated GAM GENE, and GAM1945 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[27102] GAM1945 gene, herein designated GAM GENE, encodes a GAM1945 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1945 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1945 precursor RNA is designated SEQ ID:1922, and is provided hereinbelow with reference to the sequence listing part.

[27103] GAM1945 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1945 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[27104] An enzyme complex designated DICER COMPLEX, dices the GAM1945 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1945 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM1945 RNA is designated SEQ ID:4530, and is provided hereinbelow with reference to the sequence listing part.

[27105] GAM1945 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1945 target RNA, herein designated GAM TARGET RNA. GAM1945 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[27106] GAM1945 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1945 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1945 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1945 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1945 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[27107] The complementary binding of GAM1945 RNA, herein designated GAM RNA, to target binding sites on GAM1945 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1945 target RNA, herein designated GAM TARGET RNA, into GAM1945 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[27108] It is appreciated that GAM1945 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1945 target genes. The

mRNA of each one of this plurality of GAM1945 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1945 RNA, herein designated GAM RNA, and which when bound by GAM1945 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1945 target proteins.

[27109] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1945 gene, herein designated GAM GENE, on one or more GAM1945 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[27110] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1945 correlate with, and may be deduced from, the identity of the target genes which GAM1945 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[27111] Nucleotide sequences of the GAM1945 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1945 RNA, herein

designated GAM RNA, and a schematic representation of the secondary folding of GAM1945 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1945 are further described hereinbelow with reference to Table 1.

[27112] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1945 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[27113] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1946 (GAM1946) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[27114] GAM1946 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1946 was detected is described hereinabove with reference to Figs. 2-8.

[27115] GAM1946 gene, herein designated GAM GENE, and GAM1946 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[27116] GAM1946 gene, herein designated GAM GENE, encodes a GAM1946 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1946 precursor RNA,

herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1946 precursor RNA is designated SEQ ID:1923, and is provided hereinbelow with reference to the sequence listing part.

[27117] GAM1946 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1946 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[27118] An enzyme complex designated DICER COMPLEX, dices the GAM1946 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1946 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM1946 RNA is designated SEQ ID:4531, and is provided hereinbelow with reference to the sequence listing part.

[27119] GAM1946 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1946 target RNA, herein designated GAM TARGET RNA. GAM1946 target RNA, herein designated GAM

TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[27120] GAM1946 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1946 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1946 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1946 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1946 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[27121] The complementary binding of GAM1946 RNA, herein designated GAM RNA, to target binding sites on GAM1946 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1946 target RNA, herein designated GAM TARGET RNA, into GAM1946 target protein, herein

designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[27122] It is appreciated that GAM1946 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1946 target genes. The mRNA of each one of this plurality of GAM1946 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1946 RNA, herein designated GAM RNA, and which when bound by GAM1946 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1946 target proteins.

[27123] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1946 gene, herein designated GAM GENE, on one or more GAM1946 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[27124] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1946 correlate with, and may be deduced from, the identity of the target

genes which GAM1946 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[27125] Nucleotide sequences of the GAM1946 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1946 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1946 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1946 are further described hereinbelow with reference to Table 1.

[27126] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1946 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[27127] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1947 (GAM1947) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[27128] GAM1947 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1947 was detected is described hereinabove with reference to Figs. 2-8.

[27129] GAM1947 gene, herein designated GAM GENE, and GAM1947 target gene, herein designated GAM TARGET GENE, are human genes contained in the

human genome.

[27130] GAM1947 gene, herein designated GAM GENE, encodes a GAM1947 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1947 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1947 precursor RNA is designated SEQ ID:1924, and is provided hereinbelow with reference to the sequence listing part.

[27131] GAM1947 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1947 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[27132] An enzyme complex designated DICER COMPLEX, dices the GAM1947 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1947 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM1947 RNA is designated SEQ ID:4532, and is provided

hereinbelow with reference to the sequence listing part.

[27133] GAM1947 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1947 target RNA, herein designated GAM TARGET RNA. GAM1947 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[27134] GAM1947 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1947 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1947 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1947 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1947 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[27135] The complementary binding of GAM1947 RNA, herein designated GAM RNA, to target binding sites on GAM1947 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1947 target RNA, herein designated GAM TARGET RNA, into GAM1947 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[27136] It is appreciated that GAM1947 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1947 target genes. The mRNA of each one of this plurality of GAM1947 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1947 RNA, herein designated GAM RNA, and which when bound by GAM1947 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1947 target proteins.

[27137] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1947 gene, herein designated GAM GENE, on one or more GAM1947 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding

sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[27138] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1947 correlate with, and may be deduced from, the identity of the target genes which GAM1947 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[27139] Nucleotide sequences of the GAM1947 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1947 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1947 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1947 are further described hereinbelow with reference to Table 1.

[27140] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1947 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[27141] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1948 (GAM1948) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[27142] GAM1948 is a novel bioinformatically detected regulatory, non protein

coding, micro RNA (miRNA) gene. The method by which GAM1948 was detected is described hereinabove with reference to Figs. 2-8.

[27143] GAM1948 gene, herein designated GAM GENE, and GAM1948 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[27144] GAM1948 gene, herein designated GAM GENE, encodes a GAM1948 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1948 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1948 precursor RNA is designated SEQ ID:1925, and is provided hereinbelow with reference to the sequence listing part.

[27145] GAM1948 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1948 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[27146] An enzyme complex designated DICER COMPLEX, dices the GAM1948 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1948 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin

structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 80%) nucleotide sequence of GAM1948 RNA is designated SEQ ID:4533, and is provided hereinbelow with reference to the sequence listing part.

[27147] GAM1948 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1948 target RNA, herein designated GAM TARGET RNA. GAM1948 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[27148] GAM1948 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1948 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1948 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1948 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1948 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target

binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[27149] The complementary binding of GAM1948 RNA, herein designated GAM RNA, to target binding sites on GAM1948 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1948 target RNA, herein designated GAM TARGET RNA, into GAM1948 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[27150] It is appreciated that GAM1948 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1948 target genes. The mRNA of each one of this plurality of GAM1948 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1948 RNA, herein designated GAM RNA, and which when bound by GAM1948 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1948 target proteins.

[27151] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1948 gene, herein designated GAM GENE, on one or more GAM1948 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary

binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[27152] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1948 correlate with, and may be deduced from, the identity of the target genes which GAM1948 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[27153] Nucleotide sequences of the GAM1948 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1948 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1948 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1948 are further described hereinbelow with reference to Table 1.

[27154] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1948 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[27155] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1949 (GAM1949) gene, which modulates

expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[27156] GAM1949 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1949 was detected is described hereinabove with reference to Figs. 2-8.

[27157] GAM1949 gene, herein designated GAM GENE, and GAM1949 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[27158] GAM1949 gene, herein designated GAM GENE, encodes a GAM1949 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1949 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1949 precursor RNA is designated SEQ ID:1926, and is provided hereinbelow with reference to the sequence listing part.

[27159] GAM1949 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1949 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[27160] An enzyme complex designated DICER COMPLEX, dices the GAM1949 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1949 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM1949 RNA is designated SEQ ID:4534, and is provided hereinbelow with reference to the sequence listing part.

[27161] GAM1949 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1949 target RNA, herein designated GAM TARGET RNA. GAM1949 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[27162] GAM1949 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1949 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1949 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an

illustration only, and is not meant to be limiting GAM1949 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1949 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[27163] The complementary binding of GAM1949 RNA, herein designated GAM RNA, to target binding sites on GAM1949 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1949 target RNA, herein designated GAM TARGET RNA, into GAM1949 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[27164] It is appreciated that GAM1949 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1949 target genes. The mRNA of each one of this plurality of GAM1949 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1949 RNA, herein designated GAM RNA, and which when bound by GAM1949 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1949 target proteins.

[27165] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition

exerted by GAM1949 gene, herein designated GAM GENE, on one or more GAM1949 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[27166] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1949 correlate with, and may be deduced from, the identity of the target genes which GAM1949 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[27167] Nucleotide sequences of the GAM1949 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1949 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1949 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1949 are further described hereinbelow with reference to Table 1.

[27168] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1949 RNA, herein designated GAM RNA, are described hereinbelow

with reference to Table 2.

[27169] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1950 (GAM1950) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[27170] GAM1950 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1950 was detected is described hereinabove with reference to Figs. 2-8.

[27171] GAM1950 gene, herein designated GAM GENE, and GAM1950 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[27172] GAM1950 gene, herein designated GAM GENE, encodes a GAM1950 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1950 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1950 precursor RNA is designated SEQ ID:1927, and is provided hereinbelow with reference to the sequence listing part.

[27173] GAM1950 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1950 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA

encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[27174] An enzyme complex designated DICER COMPLEX, dices the GAM1950 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1950 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 85%) nucleotide sequence of GAM1950 RNA is designated SEQ ID:4535, and is provided hereinbelow with reference to the sequence listing part.

[27175] GAM1950 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1950 target RNA, herein designated GAM TARGET RNA. GAM1950 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[27176] GAM1950 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1950 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1950 RNA,

herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1950 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1950 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[27177] The complementary binding of GAM1950 RNA, herein designated GAM RNA, to target binding sites on GAM1950 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1950 target RNA, herein designated GAM TARGET RNA, into GAM1950 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[27178] It is appreciated that GAM1950 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1950 target genes. The mRNA of each one of this plurality of GAM1950 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1950 RNA, herein designated GAM RNA, and which when bound by GAM1950 RNA, herein designated GAM RNA,

causes inhibition of translation of respective one or more GAM1950 target proteins.

[27179] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1950 gene, herein designated GAM GENE, on one or more GAM1950 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[27180] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1950 correlate with, and may be deduced from, the identity of the target genes which GAM1950 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[27181] Nucleotide sequences of the GAM1950 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1950 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1950 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1950 are further described hereinbelow with reference to Table 1.

[27182] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1950 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[27183] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1951 (GAM1951) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[27184] GAM1951 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1951 was detected is described hereinabove with reference to Figs. 2-8.

[27185] GAM1951 gene, herein designated GAM GENE, and GAM1951 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[27186] GAM1951 gene, herein designated GAM GENE, encodes a GAM1951 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1951 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1951 precursor RNA is designated SEQ ID:1928, and is provided hereinbelow with reference to the sequence listing part.

[27187] GAM1951 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1951 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[27188] An enzyme complex designated DICER COMPLEX, dices the GAM1951 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1951 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 88%) nucleotide sequence of GAM1951 RNA is designated SEQ ID:4536, and is provided hereinbelow with reference to the sequence listing part.

[27189] GAM1951 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1951 target RNA, herein designated GAM TARGET RNA. GAM1951 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[27190] GAM1951 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1951 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1951 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1951 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1951 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[27191] The complementary binding of GAM1951 RNA, herein designated GAM RNA, to target binding sites on GAM1951 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1951 target RNA, herein designated GAM TARGET RNA, into GAM1951 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[27192] It is appreciated that GAM1951 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1951 target genes. The

mRNA of each one of this plurality of GAM1951 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1951 RNA, herein designated GAM RNA, and which when bound by GAM1951 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1951 target proteins.

[27193] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1951 gene, herein designated GAM GENE, on one or more GAM1951 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[27194] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1951 correlate with, and may be deduced from, the identity of the target genes which GAM1951 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[27195] Nucleotide sequences of the GAM1951 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1951 RNA, herein

designated GAM RNA, and a schematic representation of the secondary folding of GAM1951 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1951 are further described hereinbelow with reference to Table 1.

[27196] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1951 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[27197] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1952 (GAM1952) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[27198] GAM1952 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1952 was detected is described hereinabove with reference to Figs. 2-8.

[27199] GAM1952 gene, herein designated GAM GENE, and GAM1952 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[27200] GAM1952 gene, herein designated GAM GENE, encodes a GAM1952 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1952 precursor RNA,

herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1952 precursor RNA is designated SEQ ID:1929, and is provided hereinbelow with reference to the sequence listing part.

[27201] GAM1952 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1952 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[27202] An enzyme complex designated DICER COMPLEX, dices the GAM1952 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1952 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 89%) nucleotide sequence of GAM1952 RNA is designated SEQ ID:4537, and is provided hereinbelow with reference to the sequence listing part.

[27203] GAM1952 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1952 target RNA, herein designated GAM TARGET RNA. GAM1952 target RNA, herein designated GAM

TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[27204] GAM1952 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1952 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1952 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1952 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1952 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[27205] The complementary binding of GAM1952 RNA, herein designated GAM RNA, to target binding sites on GAM1952 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1952 target RNA, herein designated GAM TARGET RNA, into GAM1952 target protein, herein

designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[27206] It is appreciated that GAM1952 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1952 target genes. The mRNA of each one of this plurality of GAM1952 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1952 RNA, herein designated GAM RNA, and which when bound by GAM1952 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1952 target proteins.

[27207] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1952 gene, herein designated GAM GENE, on one or more GAM1952 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[27208] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1952 correlate with, and may be deduced from, the identity of the target

genes which GAM1952 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[27209] Nucleotide sequences of the GAM1952 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1952 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1952 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1952 are further described hereinbelow with reference to Table 1.

[27210] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1952 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[27211] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1953 (GAM1953) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[27212] GAM1953 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1953 was detected is described hereinabove with reference to Figs. 2-8.

[27213] GAM1953 gene, herein designated GAM GENE, and GAM1953 target gene, herein designated GAM TARGET GENE, are human genes contained in the

human genome.

[27214] GAM1953 gene, herein designated GAM GENE, encodes a GAM1953 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1953 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1953 precursor RNA is designated SEQ ID:1930, and is provided hereinbelow with reference to the sequence listing part.

[27215] GAM1953 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1953 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[27216] An enzyme complex designated DICER COMPLEX, dices the GAM1953 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1953 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 79%) nucleotide sequence of GAM1953 RNA is designated SEQ ID:4538, and is provided

hereinbelow with reference to the sequence listing part.

[27217] GAM1953 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1953 target RNA, herein designated GAM TARGET RNA. GAM1953 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[27218] GAM1953 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1953 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1953 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1953 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1953 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[27219] The complementary binding of GAM1953 RNA, herein designated GAM RNA, to target binding sites on GAM1953 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1953 target RNA, herein designated GAM TARGET RNA, into GAM1953 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[27220] It is appreciated that GAM1953 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1953 target genes. The mRNA of each one of this plurality of GAM1953 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1953 RNA, herein designated GAM RNA, and which when bound by GAM1953 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1953 target proteins.

[27221] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1953 gene, herein designated GAM GENE, on one or more GAM1953 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding

sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[27222] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1953 correlate with, and may be deduced from, the identity of the target genes which GAM1953 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[27223] Nucleotide sequences of the GAM1953 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1953 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1953 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1953 are further described hereinbelow with reference to Table 1.

[27224] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1953 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[27225] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1954 (GAM1954) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[27226] GAM1954 is a novel bioinformatically detected regulatory, non protein

coding, micro RNA (miRNA) gene. The method by which GAM1954 was detected is described hereinabove with reference to Figs. 2-8.

[27227] GAM1954 gene, herein designated GAM GENE, and GAM1954 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[27228] GAM1954 gene, herein designated GAM GENE, encodes a GAM1954 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1954 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1954 precursor RNA is designated SEQ ID:1931, and is provided hereinbelow with reference to the sequence listing part.

[27229] GAM1954 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1954 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[27230] An enzyme complex designated DICER COMPLEX, dices the GAM1954 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1954 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin

structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 25%) nucleotide sequence of GAM1954 RNA is designated SEQ ID:4539, and is provided hereinbelow with reference to the sequence listing part.

[27231] GAM1954 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1954 target RNA, herein designated GAM TARGET RNA. GAM1954 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[27232] GAM1954 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1954 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1954 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1954 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1954 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target

binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[27233] The complementary binding of GAM1954 RNA, herein designated GAM RNA, to target binding sites on GAM1954 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1954 target RNA, herein designated GAM TARGET RNA, into GAM1954 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[27234] It is appreciated that GAM1954 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1954 target genes. The mRNA of each one of this plurality of GAM1954 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1954 RNA, herein designated GAM RNA, and which when bound by GAM1954 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1954 target proteins.

[27235] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1954 gene, herein designated GAM GENE, on one or more GAM1954 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary

binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[27236] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1954 correlate with, and may be deduced from, the identity of the target genes which GAM1954 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[27237] Nucleotide sequences of the GAM1954 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1954 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1954 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1954 are further described hereinbelow with reference to Table 1.

[27238] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1954 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[27239] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1955 (GAM1955) gene, which modulates

expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[27240] GAM1955 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1955 was detected is described hereinabove with reference to Figs. 2-8.

[27241] GAM1955 gene, herein designated GAM GENE, and GAM1955 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[27242] GAM1955 gene, herein designated GAM GENE, encodes a GAM1955 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1955 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1955 precursor RNA is designated SEQ ID:1932, and is provided hereinbelow with reference to the sequence listing part.

[27243] GAM1955 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1955 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[27244] An enzyme complex designated DICER COMPLEX, dices the GAM1955 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1955 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 81%) nucleotide sequence of GAM1955 RNA is designated SEQ ID:4540, and is provided hereinbelow with reference to the sequence listing part.

[27245] GAM1955 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1955 target RNA, herein designated GAM TARGET RNA. GAM1955 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[27246] GAM1955 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1955 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1955 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an

illustration only, and is not meant to be limiting GAM1955 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1955 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[27247] The complementary binding of GAM1955 RNA, herein designated GAM RNA, to target binding sites on GAM1955 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1955 target RNA, herein designated GAM TARGET RNA, into GAM1955 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[27248] It is appreciated that GAM1955 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1955 target genes. The mRNA of each one of this plurality of GAM1955 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1955 RNA, herein designated GAM RNA, and which when bound by GAM1955 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1955 target proteins.

[27249] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition

exerted by GAM1955 gene, herein designated GAM GENE, on one or more GAM1955 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[27250] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1955 correlate with, and may be deduced from, the identity of the target genes which GAM1955 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[27251] Nucleotide sequences of the GAM1955 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1955 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1955 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1955 are further described hereinbelow with reference to Table 1.

[27252] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1955 RNA, herein designated GAM RNA, are described hereinbelow

with reference to Table 2.

[27253] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1956 (GAM1956) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[27254] GAM1956 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1956 was detected is described hereinabove with reference to Figs. 2-8.

[27255] GAM1956 gene, herein designated GAM GENE, and GAM1956 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[27256] GAM1956 gene, herein designated GAM GENE, encodes a GAM1956 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1956 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1956 precursor RNA is designated SEQ ID:1933, and is provided hereinbelow with reference to the sequence listing part.

[27257] GAM1956 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1956 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA

encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[27258] An enzyme complex designated DICER COMPLEX, dices the GAM1956 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1956 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 89%) nucleotide sequence of GAM1956 RNA is designated SEQ ID:4541, and is provided hereinbelow with reference to the sequence listing part.

[27259] GAM1956 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1956 target RNA, herein designated GAM TARGET RNA. GAM1956 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[27260] GAM1956 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1956 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1956 RNA,

herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1956 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1956 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[27261] The complementary binding of GAM1956 RNA, herein designated GAM RNA, to target binding sites on GAM1956 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1956 target RNA, herein designated GAM TARGET RNA, into GAM1956 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[27262] It is appreciated that GAM1956 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1956 target genes. The mRNA of each one of this plurality of GAM1956 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1956 RNA, herein designated GAM RNA, and which when bound by GAM1956 RNA, herein designated GAM RNA,

causes inhibition of translation of respective one or more GAM1956 target proteins.

[27263] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1956 gene, herein designated GAM GENE, on one or more GAM1956 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[27264] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1956 correlate with, and may be deduced from, the identity of the target genes which GAM1956 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[27265] Nucleotide sequences of the GAM1956 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1956 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1956 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1956 are further described hereinbelow with reference to Table 1.

[27266] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1956 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[27267] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1957 (GAM1957) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[27268] GAM1957 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1957 was detected is described hereinabove with reference to Figs. 2-8.

[27269] GAM1957 gene, herein designated GAM GENE, and GAM1957 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[27270] GAM1957 gene, herein designated GAM GENE, encodes a GAM1957 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1957 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1957 precursor RNA is designated SEQ ID:1934, and is provided hereinbelow with reference to the sequence listing part.

[27271] GAM1957 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1957 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[27272] An enzyme complex designated DICER COMPLEX, dices the GAM1957 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1957 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 84%) nucleotide sequence of GAM1957 RNA is designated SEQ ID:4542, and is provided hereinbelow with reference to the sequence listing part.

[27273] GAM1957 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1957 target RNA, herein designated GAM TARGET RNA. GAM1957 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[27274] GAM1957 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1957 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1957 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1957 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1957 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[27275] The complementary binding of GAM1957 RNA, herein designated GAM RNA, to target binding sites on GAM1957 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1957 target RNA, herein designated GAM TARGET RNA, into GAM1957 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[27276] It is appreciated that GAM1957 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1957 target genes. The

mRNA of each one of this plurality of GAM1957 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1957 RNA, herein designated GAM RNA, and which when bound by GAM1957 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1957 target proteins.

[27277] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1957 gene, herein designated GAM GENE, on one or more GAM1957 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[27278] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1957 correlate with, and may be deduced from, the identity of the target genes which GAM1957 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[27279] Nucleotide sequences of the GAM1957 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1957 RNA, herein

designated GAM RNA, and a schematic representation of the secondary folding of GAM1957 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1957 are further described hereinbelow with reference to Table 1.

[27280] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1957 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[27281] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1958 (GAM1958) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[27282] GAM1958 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1958 was detected is described hereinabove with reference to Figs. 2-8.

[27283] GAM1958 gene, herein designated GAM GENE, and GAM1958 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[27284] GAM1958 gene, herein designated GAM GENE, encodes a GAM1958 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1958 precursor RNA,

herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1958 precursor RNA is designated SEQ ID:1935, and is provided hereinbelow with reference to the sequence listing part.

[27285] GAM1958 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1958 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[27286] An enzyme complex designated DICER COMPLEX, dices the GAM1958 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1958 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 79%) nucleotide sequence of GAM1958 RNA is designated SEQ ID:4543, and is provided hereinbelow with reference to the sequence listing part.

[27287] GAM1958 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1958 target RNA, herein designated GAM TARGET RNA. GAM1958 target RNA, herein designated GAM

TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[27288] GAM1958 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1958 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1958 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1958 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1958 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[27289] The complementary binding of GAM1958 RNA, herein designated GAM RNA, to target binding sites on GAM1958 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1958 target RNA, herein designated GAM TARGET RNA, into GAM1958 target protein, herein

designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[27290] It is appreciated that GAM1958 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1958 target genes. The mRNA of each one of this plurality of GAM1958 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1958 RNA, herein designated GAM RNA, and which when bound by GAM1958 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1958 target proteins.

[27291] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1958 gene, herein designated GAM GENE, on one or more GAM1958 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[27292] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1958 correlate with, and may be deduced from, the identity of the target

genes which GAM1958 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[27293] Nucleotide sequences of the GAM1958 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1958 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1958 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1958 are further described hereinbelow with reference to Table 1.

[27294] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1958 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[27295] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1959 (GAM1959) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[27296] GAM1959 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1959 was detected is described hereinabove with reference to Figs. 2-8.

[27297] GAM1959 gene, herein designated GAM GENE, and GAM1959 target gene, herein designated GAM TARGET GENE, are human genes contained in the

human genome.

[27298] GAM1959 gene, herein designated GAM GENE, encodes a GAM1959 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1959 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1959 precursor RNA is designated SEQ ID:1936, and is provided hereinbelow with reference to the sequence listing part.

[27299] GAM1959 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1959 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[27300] An enzyme complex designated DICER COMPLEX, dices the GAM1959 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1959 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM1959 RNA is designated SEQ ID:4544, and is provided

hereinbelow with reference to the sequence listing part.

[27301] GAM1959 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1959 target RNA, herein designated GAM TARGET RNA. GAM1959 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[27302] GAM1959 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1959 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1959 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1959 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1959 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[27303] The complementary binding of GAM1959 RNA, herein designated GAM RNA, to target binding sites on GAM1959 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1959 target RNA, herein designated GAM TARGET RNA, into GAM1959 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[27304] It is appreciated that GAM1959 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1959 target genes. The mRNA of each one of this plurality of GAM1959 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1959 RNA, herein designated GAM RNA, and which when bound by GAM1959 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1959 target proteins.

[27305] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1959 gene, herein designated GAM GENE, on one or more GAM1959 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding

sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[27306] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1959 correlate with, and may be deduced from, the identity of the target genes which GAM1959 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[27307] Nucleotide sequences of the GAM1959 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1959 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1959 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1959 are further described hereinbelow with reference to Table 1.

[27308] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1959 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[27309] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1960 (GAM1960) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[27310] GAM1960 is a novel bioinformatically detected regulatory, non protein

coding, micro RNA (miRNA) gene. The method by which GAM1960 was detected is described hereinabove with reference to Figs. 2-8.

[27311] GAM1960 gene, herein designated GAM GENE, and GAM1960 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[27312] GAM1960 gene, herein designated GAM GENE, encodes a GAM1960 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1960 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1960 precursor RNA is designated SEQ ID:1937, and is provided hereinbelow with reference to the sequence listing part.

[27313] GAM1960 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1960 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[27314] An enzyme complex designated DICER COMPLEX, dices the GAM1960 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1960 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin

structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 81%) nucleotide sequence of GAM1960 RNA is designated SEQ ID:4546, and is provided hereinbelow with reference to the sequence listing part.

[27315] GAM1960 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1960 target RNA, herein designated GAM TARGET RNA. GAM1960 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[27316] GAM1960 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1960 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1960 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1960 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1960 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target

binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[27317] The complementary binding of GAM1960 RNA, herein designated GAM RNA, to target binding sites on GAM1960 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1960 target RNA, herein designated GAM TARGET RNA, into GAM1960 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[27318] It is appreciated that GAM1960 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1960 target genes. The mRNA of each one of this plurality of GAM1960 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1960 RNA, herein designated GAM RNA, and which when bound by GAM1960 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1960 target proteins.

[27319] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1960 gene, herein designated GAM GENE, on one or more GAM1960 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary

binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[27320] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1960 correlate with, and may be deduced from, the identity of the target genes which GAM1960 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[27321] Nucleotide sequences of the GAM1960 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1960 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1960 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1960 are further described hereinbelow with reference to Table 1.

[27322] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1960 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[27323] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1961 (GAM1961) gene, which modulates

expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[27324] GAM1961 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1961 was detected is described hereinabove with reference to Figs. 2-8.

[27325] GAM1961 gene, herein designated GAM GENE, and GAM1961 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[27326] GAM1961 gene, herein designated GAM GENE, encodes a GAM1961 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1961 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1961 precursor RNA is designated SEQ ID:1938, and is provided hereinbelow with reference to the sequence listing part.

[27327] GAM1961 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1961 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[27328] An enzyme complex designated DICER COMPLEX, dices the GAM1961 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1961 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM1961 RNA is designated SEQ ID:4545, and is provided hereinbelow with reference to the sequence listing part.

[27329] GAM1961 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1961 target RNA, herein designated GAM TARGET RNA. GAM1961 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[27330] GAM1961 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1961 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1961 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an

illustration only, and is not meant to be limiting GAM1961 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1961 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[27331] The complementary binding of GAM1961 RNA, herein designated GAM RNA, to target binding sites on GAM1961 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1961 target RNA, herein designated GAM TARGET RNA, into GAM1961 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[27332] It is appreciated that GAM1961 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1961 target genes. The mRNA of each one of this plurality of GAM1961 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1961 RNA, herein designated GAM RNA, and which when bound by GAM1961 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1961 target proteins.

[27333] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition

exerted by GAM1961 gene, herein designated GAM GENE, on one or more GAM1961 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[27334] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1961 correlate with, and may be deduced from, the identity of the target genes which GAM1961 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[27335] Nucleotide sequences of the GAM1961 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1961 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1961 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1961 are further described hereinbelow with reference to Table 1.

[27336] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1961 RNA, herein designated GAM RNA, are described hereinbelow

with reference to Table 2.

[27337] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1962 (GAM1962) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[27338] GAM1962 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1962 was detected is described hereinabove with reference to Figs. 2-8.

[27339] GAM1962 gene, herein designated GAM GENE, and GAM1962 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[27340] GAM1962 gene, herein designated GAM GENE, encodes a GAM1962 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1962 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1962 precursor RNA is designated SEQ ID:1939, and is provided hereinbelow with reference to the sequence listing part.

[27341] GAM1962 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1962 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA

encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[27342] An enzyme complex designated DICER COMPLEX, dices the GAM1962 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1962 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 84%) nucleotide sequence of GAM1962 RNA is designated SEQ ID:4547, and is provided hereinbelow with reference to the sequence listing part.

[27343] GAM1962 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1962 target RNA, herein designated GAM TARGET RNA. GAM1962 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[27344] GAM1962 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1962 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1962 RNA,

herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1962 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1962 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[27345] The complementary binding of GAM1962 RNA, herein designated GAM RNA, to target binding sites on GAM1962 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1962 target RNA, herein designated GAM TARGET RNA, into GAM1962 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[27346] It is appreciated that GAM1962 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1962 target genes. The mRNA of each one of this plurality of GAM1962 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1962 RNA, herein designated GAM RNA, and which when bound by GAM1962 RNA, herein designated GAM RNA,

causes inhibition of translation of respective one or more GAM1962 target proteins.

[27347] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1962 gene, herein designated GAM GENE, on one or more GAM1962 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[27348] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1962 correlate with, and may be deduced from, the identity of the target genes which GAM1962 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[27349] Nucleotide sequences of the GAM1962 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1962 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1962 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1962 are further described hereinbelow with reference to Table 1.

[27350] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1962 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[27351] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1963 (GAM1963) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[27352] GAM1963 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1963 was detected is described hereinabove with reference to Figs. 2-8.

[27353] GAM1963 gene, herein designated GAM GENE, and GAM1963 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[27354] GAM1963 gene, herein designated GAM GENE, encodes a GAM1963 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1963 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1963 precursor RNA is designated SEQ ID:1940, and is provided hereinbelow with reference to the sequence listing part.

[27355] GAM1963 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1963 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[27356] An enzyme complex designated DICER COMPLEX, dices the GAM1963 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1963 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM1963 RNA is designated SEQ ID:4549, and is provided hereinbelow with reference to the sequence listing part.

[27357] GAM1963 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1963 target RNA, herein designated GAM TARGET RNA. GAM1963 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[27358] GAM1963 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1963 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1963 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1963 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1963 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[27359] The complementary binding of GAM1963 RNA, herein designated GAM RNA, to target binding sites on GAM1963 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1963 target RNA, herein designated GAM TARGET RNA, into GAM1963 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[27360] It is appreciated that GAM1963 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1963 target genes. The

mRNA of each one of this plurality of GAM1963 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1963 RNA, herein designated GAM RNA, and which when bound by GAM1963 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1963 target proteins.

[27361] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1963 gene, herein designated GAM GENE, on one or more GAM1963 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[27362] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1963 correlate with, and may be deduced from, the identity of the target genes which GAM1963 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[27363] Nucleotide sequences of the GAM1963 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1963 RNA, herein

designated GAM RNA, and a schematic representation of the secondary folding of GAM1963 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1963 are further described hereinbelow with reference to Table 1.

[27364] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1963 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[27365] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1964 (GAM1964) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[27366] GAM1964 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1964 was detected is described hereinabove with reference to Figs. 2-8.

[27367] GAM1964 gene, herein designated GAM GENE, and GAM1964 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[27368] GAM1964 gene, herein designated GAM GENE, encodes a GAM1964 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1964 precursor RNA,

herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1964 precursor RNA is designated SEQ ID:1941, and is provided hereinbelow with reference to the sequence listing part.

[27369] GAM1964 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1964 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[27370] An enzyme complex designated DICER COMPLEX, dices the GAM1964 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1964 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 79%) nucleotide sequence of GAM1964 RNA is designated SEQ ID:4548, and is provided hereinbelow with reference to the sequence listing part.

[27371] GAM1964 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1964 target RNA, herein designated GAM TARGET RNA. GAM1964 target RNA, herein designated GAM

TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[27372] GAM1964 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1964 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1964 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1964 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1964 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[27373] The complementary binding of GAM1964 RNA, herein designated GAM RNA, to target binding sites on GAM1964 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1964 target RNA, herein designated GAM TARGET RNA, into GAM1964 target protein, herein

designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[27374] It is appreciated that GAM1964 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1964 target genes. The mRNA of each one of this plurality of GAM1964 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1964 RNA, herein designated GAM RNA, and which when bound by GAM1964 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1964 target proteins.

[27375] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1964 gene, herein designated GAM GENE, on one or more GAM1964 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[27376] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1964 correlate with, and may be deduced from, the identity of the target

genes which GAM1964 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[27377] Nucleotide sequences of the GAM1964 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1964 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1964 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1964 are further described hereinbelow with reference to Table 1.

[27378] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1964 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[27379] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1965 (GAM1965) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[27380] GAM1965 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1965 was detected is described hereinabove with reference to Figs. 2-8.

[27381] GAM1965 gene, herein designated GAM GENE, and GAM1965 target gene, herein designated GAM TARGET GENE, are human genes contained in the

human genome.

[27382] GAM1965 gene, herein designated GAM GENE, encodes a GAM1965 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1965 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1965 precursor RNA is designated SEQ ID:1942, and is provided hereinbelow with reference to the sequence listing part.

[27383] GAM1965 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1965 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[27384] An enzyme complex designated DICER COMPLEX, dices the GAM1965 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1965 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 83%) nucleotide sequence of GAM1965 RNA is designated SEQ ID:4550, and is provided

hereinbelow with reference to the sequence listing part.

[27385] GAM1965 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1965 target RNA, herein designated GAM TARGET RNA. GAM1965 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[27386] GAM1965 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1965 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1965 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1965 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1965 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[27387] The complementary binding of GAM1965 RNA, herein designated GAM RNA, to target binding sites on GAM1965 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1965 target RNA, herein designated GAM TARGET RNA, into GAM1965 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[27388] It is appreciated that GAM1965 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1965 target genes. The mRNA of each one of this plurality of GAM1965 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1965 RNA, herein designated GAM RNA, and which when bound by GAM1965 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1965 target proteins.

[27389] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1965 gene, herein designated GAM GENE, on one or more GAM1965 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding

sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[27390] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1965 correlate with, and may be deduced from, the identity of the target genes which GAM1965 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[27391] Nucleotide sequences of the GAM1965 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1965 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1965 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1965 are further described hereinbelow with reference to Table 1.

[27392] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1965 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[27393] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1966 (GAM1966) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[27394] GAM1966 is a novel bioinformatically detected regulatory, non protein

coding, micro RNA (miRNA) gene. The method by which GAM1966 was detected is described hereinabove with reference to Figs. 2-8.

[27395] GAM1966 gene, herein designated GAM GENE, and GAM1966 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[27396] GAM1966 gene, herein designated GAM GENE, encodes a GAM1966 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1966 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1966 precursor RNA is designated SEQ ID:1943, and is provided hereinbelow with reference to the sequence listing part.

[27397] GAM1966 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1966 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[27398] An enzyme complex designated DICER COMPLEX, dices the GAM1966 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1966 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin

structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM1966 RNA is designated SEQ ID:4551, and is provided hereinbelow with reference to the sequence listing part.

[27399] GAM1966 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1966 target RNA, herein designated GAM TARGET RNA. GAM1966 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[27400] GAM1966 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1966 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1966 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1966 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1966 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target

binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[27401] The complementary binding of GAM1966 RNA, herein designated GAM RNA, to target binding sites on GAM1966 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1966 target RNA, herein designated GAM TARGET RNA, into GAM1966 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[27402] It is appreciated that GAM1966 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1966 target genes. The mRNA of each one of this plurality of GAM1966 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1966 RNA, herein designated GAM RNA, and which when bound by GAM1966 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1966 target proteins.

[27403] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1966 gene, herein designated GAM GENE, on one or more GAM1966 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary

binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[27404] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1966 correlate with, and may be deduced from, the identity of the target genes which GAM1966 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[27405] Nucleotide sequences of the GAM1966 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1966 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1966 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1966 are further described hereinbelow with reference to Table 1.

[27406] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1966 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[27407] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1967 (GAM1967) gene, which modulates

expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[27408] GAM1967 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1967 was detected is described hereinabove with reference to Figs. 2-8.

[27409] GAM1967 gene, herein designated GAM GENE, and GAM1967 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[27410] GAM1967 gene, herein designated GAM GENE, encodes a GAM1967 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1967 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1967 precursor RNA is designated SEQ ID:1944, and is provided hereinbelow with reference to the sequence listing part.

[27411] GAM1967 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1967 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[27412] An enzyme complex designated DICER COMPLEX, dices the GAM1967 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1967 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 78%) nucleotide sequence of GAM1967 RNA is designated SEQ ID:4552, and is provided hereinbelow with reference to the sequence listing part.

[27413] GAM1967 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1967 target RNA, herein designated GAM TARGET RNA. GAM1967 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[27414] GAM1967 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1967 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1967 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an

illustration only, and is not meant to be limiting GAM1967 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1967 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[27415] The complementary binding of GAM1967 RNA, herein designated GAM RNA, to target binding sites on GAM1967 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1967 target RNA, herein designated GAM TARGET RNA, into GAM1967 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[27416] It is appreciated that GAM1967 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1967 target genes. The mRNA of each one of this plurality of GAM1967 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1967 RNA, herein designated GAM RNA, and which when bound by GAM1967 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1967 target proteins.

[27417] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition

exerted by GAM1967 gene, herein designated GAM GENE, on one or more GAM1967 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[27418] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1967 correlate with, and may be deduced from, the identity of the target genes which GAM1967 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[27419] Nucleotide sequences of the GAM1967 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1967 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1967 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1967 are further described hereinbelow with reference to Table 1.

[27420] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1967 RNA, herein designated GAM RNA, are described hereinbelow

with reference to Table 2.

[27421] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1968 (GAM1968) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[27422] GAM1968 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1968 was detected is described hereinabove with reference to Figs. 2-8.

[27423] GAM1968 gene, herein designated GAM GENE, and GAM1968 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[27424] GAM1968 gene, herein designated GAM GENE, encodes a GAM1968 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1968 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1968 precursor RNA is designated SEQ ID:1945, and is provided hereinbelow with reference to the sequence listing part.

[27425] GAM1968 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1968 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA

encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[27426] An enzyme complex designated DICER COMPLEX, dices the GAM1968 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1968 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 83%) nucleotide sequence of GAM1968 RNA is designated SEQ ID:4553, and is provided hereinbelow with reference to the sequence listing part.

[27427] GAM1968 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1968 target RNA, herein designated GAM TARGET RNA. GAM1968 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[27428] GAM1968 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1968 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1968 RNA,

herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1968 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1968 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[27429] The complementary binding of GAM1968 RNA, herein designated GAM RNA, to target binding sites on GAM1968 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1968 target RNA, herein designated GAM TARGET RNA, into GAM1968 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[27430] It is appreciated that GAM1968 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1968 target genes. The mRNA of each one of this plurality of GAM1968 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1968 RNA, herein designated GAM RNA, and which when bound by GAM1968 RNA, herein designated GAM RNA,

causes inhibition of translation of respective one or more GAM1968 target proteins.

[27431] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1968 gene, herein designated GAM GENE, on one or more GAM1968 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[27432] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1968 correlate with, and may be deduced from, the identity of the target genes which GAM1968 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[27433] Nucleotide sequences of the GAM1968 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1968 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1968 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1968 are further described hereinbelow with reference to Table 1.

[27434] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1968 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[27435] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1969 (GAM1969) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[27436] GAM1969 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1969 was detected is described hereinabove with reference to Figs. 2-8.

[27437] GAM1969 gene, herein designated GAM GENE, and GAM1969 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[27438] GAM1969 gene, herein designated GAM GENE, encodes a GAM1969 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1969 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1969 precursor RNA is designated SEQ ID:1946, and is provided hereinbelow with reference to the sequence listing part.

[27439] GAM1969 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1969 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[27440] An enzyme complex designated DICER COMPLEX, dices the GAM1969 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1969 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 79%) nucleotide sequence of GAM1969 RNA is designated SEQ ID:4554, and is provided hereinbelow with reference to the sequence listing part.

[27441] GAM1969 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1969 target RNA, herein designated GAM TARGET RNA. GAM1969 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[27442] GAM1969 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1969 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1969 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1969 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1969 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[27443] The complementary binding of GAM1969 RNA, herein designated GAM RNA, to target binding sites on GAM1969 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1969 target RNA, herein designated GAM TARGET RNA, into GAM1969 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[27444] It is appreciated that GAM1969 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1969 target genes. The

mRNA of each one of this plurality of GAM1969 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1969 RNA, herein designated GAM RNA, and which when bound by GAM1969 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1969 target proteins.

[27445] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1969 gene, herein designated GAM GENE, on one or more GAM1969 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[27446] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1969 correlate with, and may be deduced from, the identity of the target genes which GAM1969 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[27447] Nucleotide sequences of the GAM1969 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1969 RNA, herein

designated GAM RNA, and a schematic representation of the secondary folding of GAM1969 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1969 are further described hereinbelow with reference to Table 1.

[27448] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1969 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[27449] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1970 (GAM1970) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[27450] GAM1970 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1970 was detected is described hereinabove with reference to Figs. 2-8.

[27451] GAM1970 gene, herein designated GAM GENE, and GAM1970 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[27452] GAM1970 gene, herein designated GAM GENE, encodes a GAM1970 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1970 precursor RNA,

herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1970 precursor RNA is designated SEQ ID:1947, and is provided hereinbelow with reference to the sequence listing part.

[27453] GAM1970 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1970 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[27454] An enzyme complex designated DICER COMPLEX, dices the GAM1970 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1970 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 78%) nucleotide sequence of GAM1970 RNA is designated SEQ ID:4555, and is provided hereinbelow with reference to the sequence listing part.

[27455] GAM1970 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1970 target RNA, herein designated GAM TARGET RNA. GAM1970 target RNA, herein designated GAM

TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[27456] GAM1970 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1970 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1970 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1970 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1970 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[27457] The complementary binding of GAM1970 RNA, herein designated GAM RNA, to target binding sites on GAM1970 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1970 target RNA, herein designated GAM TARGET RNA, into GAM1970 target protein, herein

designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[27458] It is appreciated that GAM1970 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1970 target genes. The mRNA of each one of this plurality of GAM1970 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1970 RNA, herein designated GAM RNA, and which when bound by GAM1970 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1970 target proteins.

[27459] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1970 gene, herein designated GAM GENE, on one or more GAM1970 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[27460] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1970 correlate with, and may be deduced from, the identity of the target

genes which GAM1970 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[27461] Nucleotide sequences of the GAM1970 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1970 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1970 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1970 are further described hereinbelow with reference to Table 1.

[27462] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1970 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[27463] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1971 (GAM1971) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[27464] GAM1971 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1971 was detected is described hereinabove with reference to Figs. 2-8.

[27465] GAM1971 gene, herein designated GAM GENE, and GAM1971 target gene, herein designated GAM TARGET GENE, are human genes contained in the

human genome.

[27466] GAM1971 gene, herein designated GAM GENE, encodes a GAM1971 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1971 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1971 precursor RNA is designated SEQ ID:1948, and is provided hereinbelow with reference to the sequence listing part.

[27467] GAM1971 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1971 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[27468] An enzyme complex designated DICER COMPLEX, dices the GAM1971 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1971 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 81%) nucleotide sequence of GAM1971 RNA is designated SEQ ID:4556, and is provided

hereinbelow with reference to the sequence listing part.

[27469] GAM1971 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1971 target RNA, herein designated GAM TARGET RNA. GAM1971 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[27470] GAM1971 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1971 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1971 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1971 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1971 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[27471] The complementary binding of GAM1971 RNA, herein designated GAM RNA, to target binding sites on GAM1971 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1971 target RNA, herein designated GAM TARGET RNA, into GAM1971 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[27472] It is appreciated that GAM1971 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1971 target genes. The mRNA of each one of this plurality of GAM1971 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1971 RNA, herein designated GAM RNA, and which when bound by GAM1971 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1971 target proteins.

[27473] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1971 gene, herein designated GAM GENE, on one or more GAM1971 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding

sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[27474] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1971 correlate with, and may be deduced from, the identity of the target genes which GAM1971 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[27475] Nucleotide sequences of the GAM1971 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1971 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1971 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1971 are further described hereinbelow with reference to Table 1.

[27476] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1971 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[27477] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1972 (GAM1972) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[27478] GAM1972 is a novel bioinformatically detected regulatory, non protein

coding, micro RNA (miRNA) gene. The method by which GAM1972 was detected is described hereinabove with reference to Figs. 2-8.

[27479] GAM1972 gene, herein designated GAM GENE, and GAM1972 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[27480] GAM1972 gene, herein designated GAM GENE, encodes a GAM1972 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1972 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1972 precursor RNA is designated SEQ ID:1949, and is provided hereinbelow with reference to the sequence listing part.

[27481] GAM1972 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1972 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[27482] An enzyme complex designated DICER COMPLEX, dices the GAM1972 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1972 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin

structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 90%) nucleotide sequence of GAM1972 RNA is designated SEQ ID:4557, and is provided hereinbelow with reference to the sequence listing part.

[27483] GAM1972 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1972 target RNA, herein designated GAM TARGET RNA. GAM1972 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[27484] GAM1972 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1972 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1972 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1972 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1972 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target

binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[27485] The complementary binding of GAM1972 RNA, herein designated GAM RNA, to target binding sites on GAM1972 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1972 target RNA, herein designated GAM TARGET RNA, into GAM1972 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[27486] It is appreciated that GAM1972 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1972 target genes. The mRNA of each one of this plurality of GAM1972 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1972 RNA, herein designated GAM RNA, and which when bound by GAM1972 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1972 target proteins.

[27487] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1972 gene, herein designated GAM GENE, on one or more GAM1972 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary

binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[27488] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1972 correlate with, and may be deduced from, the identity of the target genes which GAM1972 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[27489] Nucleotide sequences of the GAM1972 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1972 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1972 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1972 are further described hereinbelow with reference to Table 1.

[27490] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1972 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[27491] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1973 (GAM1973) gene, which modulates

expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[27492] GAM1973 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1973 was detected is described hereinabove with reference to Figs. 2-8.

[27493] GAM1973 gene, herein designated GAM GENE, and GAM1973 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[27494] GAM1973 gene, herein designated GAM GENE, encodes a GAM1973 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1973 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1973 precursor RNA is designated SEQ ID:1950, and is provided hereinbelow with reference to the sequence listing part.

[27495] GAM1973 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1973 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[27496] An enzyme complex designated DICER COMPLEX, dices the GAM1973 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1973 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 82%) nucleotide sequence of GAM1973 RNA is designated SEQ ID:4558, and is provided hereinbelow with reference to the sequence listing part.

[27497] GAM1973 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1973 target RNA, herein designated GAM TARGET RNA. GAM1973 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[27498] GAM1973 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1973 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1973 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an

illustration only, and is not meant to be limiting GAM1973 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1973 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[27499] The complementary binding of GAM1973 RNA, herein designated GAM RNA, to target binding sites on GAM1973 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1973 target RNA, herein designated GAM TARGET RNA, into GAM1973 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[27500] It is appreciated that GAM1973 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1973 target genes. The mRNA of each one of this plurality of GAM1973 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1973 RNA, herein designated GAM RNA, and which when bound by GAM1973 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1973 target proteins.

[27501] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition

exerted by GAM1973 gene, herein designated GAM GENE, on one or more GAM1973 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[27502] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1973 correlate with, and may be deduced from, the identity of the target genes which GAM1973 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[27503] Nucleotide sequences of the GAM1973 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1973 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1973 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1973 are further described hereinbelow with reference to Table 1.

[27504] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1973 RNA, herein designated GAM RNA, are described hereinbelow

with reference to Table 2.

[27505] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1974 (GAM1974) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[27506] GAM1974 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1974 was detected is described hereinabove with reference to Figs. 2-8.

[27507] GAM1974 gene, herein designated GAM GENE, and GAM1974 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[27508] GAM1974 gene, herein designated GAM GENE, encodes a GAM1974 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1974 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1974 precursor RNA is designated SEQ ID:1951, and is provided hereinbelow with reference to the sequence listing part.

[27509] GAM1974 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1974 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA

encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[27510] An enzyme complex designated DICER COMPLEX, dices the GAM1974 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1974 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 86%) nucleotide sequence of GAM1974 RNA is designated SEQ ID:4559, and is provided hereinbelow with reference to the sequence listing part.

[27511] GAM1974 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1974 target RNA, herein designated GAM TARGET RNA. GAM1974 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[27512] GAM1974 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1974 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1974 RNA,

herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1974 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1974 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[27513] The complementary binding of GAM1974 RNA, herein designated GAM RNA, to target binding sites on GAM1974 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1974 target RNA, herein designated GAM TARGET RNA, into GAM1974 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[27514] It is appreciated that GAM1974 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1974 target genes. The mRNA of each one of this plurality of GAM1974 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1974 RNA, herein designated GAM RNA, and which when bound by GAM1974 RNA, herein designated GAM RNA,

causes inhibition of translation of respective one or more GAM1974 target proteins.

[27515] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1974 gene, herein designated GAM GENE, on one or more GAM1974 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[27516] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1974 correlate with, and may be deduced from, the identity of the target genes which GAM1974 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[27517] Nucleotide sequences of the GAM1974 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1974 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1974 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1974 are further described hereinbelow with reference to Table 1.

[27518] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1974 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[27519] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1975 (GAM1975) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[27520] GAM1975 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1975 was detected is described hereinabove with reference to Figs. 2-8.

[27521] GAM1975 gene, herein designated GAM GENE, and GAM1975 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[27522] GAM1975 gene, herein designated GAM GENE, encodes a GAM1975 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1975 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1975 precursor RNA is designated SEQ ID:1952, and is provided hereinbelow with reference to the sequence listing part.

[27523] GAM1975 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1975 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[27524] An enzyme complex designated DICER COMPLEX, dices the GAM1975 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1975 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM1975 RNA is designated SEQ ID:4560, and is provided hereinbelow with reference to the sequence listing part.

[27525] GAM1975 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1975 target RNA, herein designated GAM TARGET RNA. GAM1975 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[27526] GAM1975 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1975 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1975 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1975 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1975 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[27527] The complementary binding of GAM1975 RNA, herein designated GAM RNA, to target binding sites on GAM1975 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1975 target RNA, herein designated GAM TARGET RNA, into GAM1975 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[27528] It is appreciated that GAM1975 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1975 target genes. The

mRNA of each one of this plurality of GAM1975 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1975 RNA, herein designated GAM RNA, and which when bound by GAM1975 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1975 target proteins.

[27529] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1975 gene, herein designated GAM GENE, on one or more GAM1975 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[27530] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1975 correlate with, and may be deduced from, the identity of the target genes which GAM1975 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[27531] Nucleotide sequences of the GAM1975 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1975 RNA, herein

designated GAM RNA, and a schematic representation of the secondary folding of GAM1975 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1975 are further described hereinbelow with reference to Table 1.

[27532] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1975 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[27533] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1976 (GAM1976) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[27534] GAM1976 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1976 was detected is described hereinabove with reference to Figs. 2-8.

[27535] GAM1976 gene, herein designated GAM GENE, and GAM1976 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[27536] GAM1976 gene, herein designated GAM GENE, encodes a GAM1976 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1976 precursor RNA,

herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1976 precursor RNA is designated SEQ ID:1953, and is provided hereinbelow with reference to the sequence listing part.

[27537] GAM1976 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1976 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[27538] An enzyme complex designated DICER COMPLEX, dices the GAM1976 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1976 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM1976 RNA is designated SEQ ID:4561, and is provided hereinbelow with reference to the sequence listing part.

[27539] GAM1976 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1976 target RNA, herein designated GAM TARGET RNA. GAM1976 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[27540] GAM1976 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1976 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1976 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1976 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1976 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[27541] The complementary binding of GAM1976 RNA, herein designated GAM RNA, to target binding sites on GAM1976 target RNA, herein designated

GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1976 target RNA, herein designated GAM TARGET RNA, into GAM1976 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[27542] It is appreciated that GAM1976 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1976 target genes. The mRNA of each one of this plurality of GAM1976 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1976 RNA, herein designated GAM RNA, and which when bound by GAM1976 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1976 target proteins.

[27543] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1976 gene, herein designated GAM GENE, on one or more GAM1976 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[27544] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1976 correlate with, and may be deduced from, the identity of the target genes which GAM1976 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[27545] Nucleotide sequences of the GAM1976 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1976 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1976 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1976 are further described hereinbelow with reference to Table 1.

[27546] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1976 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[27547] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1977 (GAM1977) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[27548] GAM1977 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1977 was detected is described hereinabove with reference to Figs. 2-8.

[27549] GAM1977 gene, herein designated GAM GENE, and GAM1977 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[27550] GAM1977 gene, herein designated GAM GENE, encodes a GAM1977 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1977 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1977 precursor RNA is designated SEQ ID:1954, and is provided hereinbelow with reference to the sequence listing part.

[27551] GAM1977 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1977 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[27552] An enzyme complex designated DICER COMPLEX, dices the GAM1977 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1977 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer

together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM1977 RNA is designated SEQ ID:4562, and is provided hereinbelow with reference to the sequence listing part.

[27553] GAM1977 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1977 target RNA, herein designated GAM TARGET RNA. GAM1977 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[27554] GAM1977 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1977 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1977 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1977 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1977 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or

in both 3UTR and 5UTR regions.

[27555] The complementary binding of GAM1977 RNA, herein designated GAM RNA, to target binding sites on GAM1977 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1977 target RNA, herein designated GAM TARGET RNA, into GAM1977 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[27556] It is appreciated that GAM1977 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1977 target genes. The mRNA of each one of this plurality of GAM1977 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1977 RNA, herein designated GAM RNA, and which when bound by GAM1977 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1977 target proteins.

[27557] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1977 gene, herein designated GAM GENE, on one or more GAM1977 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes

are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[27558] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1977 correlate with, and may be deduced from, the identity of the target genes which GAM1977 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[27559] Nucleotide sequences of the GAM1977 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1977 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1977 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1977 are further described hereinbelow with reference to Table 1.

[27560] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1977 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[27561] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1978 (GAM1978) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[27562] GAM1978 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1978 was detected is described hereinabove with reference to Figs. 2-8.

[27563] GAM1978 gene, herein designated GAM GENE, and GAM1978 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[27564] GAM1978 gene, herein designated GAM GENE, encodes a GAM1978 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1978 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1978 precursor RNA is designated SEQ ID:1955, and is provided hereinbelow with reference to the sequence listing part.

[27565] GAM1978 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1978 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[27566] An enzyme complex designated DICER COMPLEX, dices the GAM1978 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1978 RNA, herein designated GAM RNA, a single stranded

~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM1978 RNA is designated SEQ ID:4563, and is provided hereinbelow with reference to the sequence listing part.

[27567] GAM1978 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1978 target RNA, herein designated GAM TARGET RNA. GAM1978 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[27568] GAM1978 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1978 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1978 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1978 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1978 target RNA, herein designated GAM

TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[27569] The complementary binding of GAM1978 RNA, herein designated GAM RNA, to target binding sites on GAM1978 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1978 target RNA, herein designated GAM TARGET RNA, into GAM1978 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[27570] It is appreciated that GAM1978 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1978 target genes. The mRNA of each one of this plurality of GAM1978 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1978 RNA, herein designated GAM RNA, and which when bound by GAM1978 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1978 target proteins.

[27571] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1978 gene, herein designated GAM GENE, on one or more GAM1978 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with

reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[27572] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1978 correlate with, and may be deduced from, the identity of the target genes which GAM1978 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[27573] Nucleotide sequences of the GAM1978 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1978 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1978 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1978 are further described hereinbelow with reference to Table 1.

[27574] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1978 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[27575] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as

Genomic Address Messenger 1979 (GAM1979) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[27576] GAM1979 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1979 was detected is described hereinabove with reference to Figs. 2-8.

[27577] GAM1979 gene, herein designated GAM GENE, and GAM1979 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[27578] GAM1979 gene, herein designated GAM GENE, encodes a GAM1979 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1979 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1979 precursor RNA is designated SEQ ID:1956, and is provided hereinbelow with reference to the sequence listing part.

[27579] GAM1979 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1979 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[27580] An enzyme complex designated DICER COMPLEX, dices the GAM1979 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1979 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 88%) nucleotide sequence of GAM1979 RNA is designated SEQ ID:4564, and is provided hereinbelow with reference to the sequence listing part.

[27581] GAM1979 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1979 target RNA, herein designated GAM TARGET RNA. GAM1979 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[27582] GAM1979 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1979 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1979 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an

illustration only, and is not meant to be limiting GAM1979 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1979 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[27583] The complementary binding of GAM1979 RNA, herein designated GAM RNA, to target binding sites on GAM1979 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1979 target RNA, herein designated GAM TARGET RNA, into GAM1979 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[27584] It is appreciated that GAM1979 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1979 target genes. The mRNA of each one of this plurality of GAM1979 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1979 RNA, herein designated GAM RNA, and which when bound by GAM1979 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1979 target proteins.

[27585] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition

exerted by GAM1979 gene, herein designated GAM GENE, on one or more GAM1979 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[27586] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1979 correlate with, and may be deduced from, the identity of the target genes which GAM1979 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[27587] Nucleotide sequences of the GAM1979 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1979 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1979 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1979 are further described hereinbelow with reference to Table 1.

[27588] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1979 RNA, herein designated GAM RNA, are described hereinbelow

with reference to Table 2.

[27589] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1980 (GAM1980) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[27590] GAM1980 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1980 was detected is described hereinabove with reference to Figs. 2-8.

[27591] GAM1980 gene, herein designated GAM GENE, and GAM1980 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[27592] GAM1980 gene, herein designated GAM GENE, encodes a GAM1980 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1980 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1980 precursor RNA is designated SEQ ID:1957, and is provided hereinbelow with reference to the sequence listing part.

[27593] GAM1980 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1980 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA

encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[27594] An enzyme complex designated DICER COMPLEX, dices the GAM1980 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1980 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 93%) nucleotide sequence of GAM1980 RNA is designated SEQ ID:4565, and is provided hereinbelow with reference to the sequence listing part.

[27595] GAM1980 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1980 target RNA, herein designated GAM TARGET RNA. GAM1980 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[27596] GAM1980 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1980 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1980 RNA,

herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1980 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1980 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[27597] The complementary binding of GAM1980 RNA, herein designated GAM RNA, to target binding sites on GAM1980 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1980 target RNA, herein designated GAM TARGET RNA, into GAM1980 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[27598] It is appreciated that GAM1980 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1980 target genes. The mRNA of each one of this plurality of GAM1980 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1980 RNA, herein designated GAM RNA, and which when bound by GAM1980 RNA, herein designated GAM RNA,

causes inhibition of translation of respective one or more GAM1980 target proteins.

[27599] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1980 gene, herein designated GAM GENE, on one or more GAM1980 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[27600] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1980 correlate with, and may be deduced from, the identity of the target genes which GAM1980 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[27601] Nucleotide sequences of the GAM1980 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1980 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1980 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1980 are further described hereinbelow with reference to Table 1.

[27602] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1980 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[27603] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1981 (GAM1981) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[27604] GAM1981 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1981 was detected is described hereinabove with reference to Figs. 2-8.

[27605] GAM1981 gene, herein designated GAM GENE, and GAM1981 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[27606] GAM1981 gene, herein designated GAM GENE, encodes a GAM1981 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1981 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1981 precursor RNA is designated SEQ ID:1958, and is provided hereinbelow with reference to the sequence listing part.

[27607] GAM1981 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1981 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[27608] An enzyme complex designated DICER COMPLEX, dices the GAM1981 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1981 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 84%) nucleotide sequence of GAM1981 RNA is designated SEQ ID:4566, and is provided hereinbelow with reference to the sequence listing part.

[27609] GAM1981 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1981 target RNA, herein designated GAM TARGET RNA. GAM1981 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[27610] GAM1981 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1981 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1981 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1981 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1981 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[27611] The complementary binding of GAM1981 RNA, herein designated GAM RNA, to target binding sites on GAM1981 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1981 target RNA, herein designated GAM TARGET RNA, into GAM1981 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[27612] It is appreciated that GAM1981 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1981 target genes. The

mRNA of each one of this plurality of GAM1981 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1981 RNA, herein designated GAM RNA, and which when bound by GAM1981 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1981 target proteins.

[27613] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1981 gene, herein designated GAM GENE, on one or more GAM1981 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[27614] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1981 correlate with, and may be deduced from, the identity of the target genes which GAM1981 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[27615] Nucleotide sequences of the GAM1981 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1981 RNA, herein

designated GAM RNA, and a schematic representation of the secondary folding of GAM1981 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1981 are further described hereinbelow with reference to Table 1.

[27616] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1981 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[27617] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1982 (GAM1982) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[27618] GAM1982 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1982 was detected is described hereinabove with reference to Figs. 2-8.

[27619] GAM1982 gene, herein designated GAM GENE, and GAM1982 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[27620] GAM1982 gene, herein designated GAM GENE, encodes a GAM1982 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1982 precursor RNA,

herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1982 precursor RNA is designated SEQ ID:1959, and is provided hereinbelow with reference to the sequence listing part.

[27621] GAM1982 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1982 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[27622] An enzyme complex designated DICER COMPLEX, dices the GAM1982 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1982 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 80%) nucleotide sequence of GAM1982 RNA is designated SEQ ID:4567, and is provided hereinbelow with reference to the sequence listing part.

[27623] GAM1982 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1982 target RNA, herein designated GAM TARGET RNA. GAM1982 target RNA, herein designated GAM

TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[27624] GAM1982 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1982 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1982 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1982 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1982 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[27625] The complementary binding of GAM1982 RNA, herein designated GAM RNA, to target binding sites on GAM1982 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1982 target RNA, herein designated GAM TARGET RNA, into GAM1982 target protein, herein

designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[27626] It is appreciated that GAM1982 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1982 target genes. The mRNA of each one of this plurality of GAM1982 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1982 RNA, herein designated GAM RNA, and which when bound by GAM1982 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1982 target proteins.

[27627] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1982 gene, herein designated GAM GENE, on one or more GAM1982 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[27628] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1982 correlate with, and may be deduced from, the identity of the target

genes which GAM1982 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[27629] Nucleotide sequences of the GAM1982 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1982 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1982 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1982 are further described hereinbelow with reference to Table 1.

[27630] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1982 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[27631] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1983 (GAM1983) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[27632] GAM1983 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1983 was detected is described hereinabove with reference to Figs. 2-8.

[27633] GAM1983 gene, herein designated GAM GENE, and GAM1983 target gene, herein designated GAM TARGET GENE, are human genes contained in the

human genome.

[27634] GAM1983 gene, herein designated GAM GENE, encodes a GAM1983 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1983 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1983 precursor RNA is designated SEQ ID:1960, and is provided hereinbelow with reference to the sequence listing part.

[27635] GAM1983 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1983 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[27636] An enzyme complex designated DICER COMPLEX, dices the GAM1983 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1983 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 82%) nucleotide sequence of GAM1983 RNA is designated SEQ ID:4569, and is provided

hereinbelow with reference to the sequence listing part.

[27637] GAM1983 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1983 target RNA, herein designated GAM TARGET RNA. GAM1983 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[27638] GAM1983 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1983 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1983 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1983 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1983 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[27639] The complementary binding of GAM1983 RNA, herein designated GAM RNA, to target binding sites on GAM1983 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1983 target RNA, herein designated GAM TARGET RNA, into GAM1983 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[27640] It is appreciated that GAM1983 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1983 target genes. The mRNA of each one of this plurality of GAM1983 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1983 RNA, herein designated GAM RNA, and which when bound by GAM1983 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1983 target proteins.

[27641] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1983 gene, herein designated GAM GENE, on one or more GAM1983 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding

sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[27642] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1983 correlate with, and may be deduced from, the identity of the target genes which GAM1983 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[27643] Nucleotide sequences of the GAM1983 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1983 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1983 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1983 are further described hereinbelow with reference to Table 1.

[27644] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1983 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[27645] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1984 (GAM1984) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[27646] GAM1984 is a novel bioinformatically detected regulatory, non protein

coding, micro RNA (miRNA) gene. The method by which GAM1984 was detected is described hereinabove with reference to Figs. 2-8.

[27647] GAM1984 gene, herein designated GAM GENE, and GAM1984 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[27648] GAM1984 gene, herein designated GAM GENE, encodes a GAM1984 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1984 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1984 precursor RNA is designated SEQ ID:1961, and is provided hereinbelow with reference to the sequence listing part.

[27649] GAM1984 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1984 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[27650] An enzyme complex designated DICER COMPLEX, dices the GAM1984 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1984 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin

structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 82%) nucleotide sequence of GAM1984 RNA is designated SEQ ID:4568, and is provided hereinbelow with reference to the sequence listing part.

[27651] GAM1984 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1984 target RNA, herein designated GAM TARGET RNA. GAM1984 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[27652] GAM1984 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1984 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1984 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1984 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1984 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target

binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[27653] The complementary binding of GAM1984 RNA, herein designated GAM RNA, to target binding sites on GAM1984 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1984 target RNA, herein designated GAM TARGET RNA, into GAM1984 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[27654] It is appreciated that GAM1984 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1984 target genes. The mRNA of each one of this plurality of GAM1984 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1984 RNA, herein designated GAM RNA, and which when bound by GAM1984 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1984 target proteins.

[27655] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1984 gene, herein designated GAM GENE, on one or more GAM1984 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary

binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[27656] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1984 correlate with, and may be deduced from, the identity of the target genes which GAM1984 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[27657] Nucleotide sequences of the GAM1984 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1984 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1984 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1984 are further described hereinbelow with reference to Table 1.

[27658] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1984 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[27659] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1985 (GAM1985) gene, which modulates

expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[27660] GAM1985 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1985 was detected is described hereinabove with reference to Figs. 2-8.

[27661] GAM1985 gene, herein designated GAM GENE, and GAM1985 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[27662] GAM1985 gene, herein designated GAM GENE, encodes a GAM1985 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1985 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1985 precursor RNA is designated SEQ ID:1962, and is provided hereinbelow with reference to the sequence listing part.

[27663] GAM1985 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1985 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[27664] An enzyme complex designated DICER COMPLEX, dices the GAM1985 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1985 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 76%) nucleotide sequence of GAM1985 RNA is designated SEQ ID:4570, and is provided hereinbelow with reference to the sequence listing part.

[27665] GAM1985 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1985 target RNA, herein designated GAM TARGET RNA. GAM1985 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[27666] GAM1985 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1985 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1985 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an

illustration only, and is not meant to be limiting GAM1985 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1985 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[27667] The complementary binding of GAM1985 RNA, herein designated GAM RNA, to target binding sites on GAM1985 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1985 target RNA, herein designated GAM TARGET RNA, into GAM1985 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[27668] It is appreciated that GAM1985 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1985 target genes. The mRNA of each one of this plurality of GAM1985 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1985 RNA, herein designated GAM RNA, and which when bound by GAM1985 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1985 target proteins.

[27669] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition

exerted by GAM1985 gene, herein designated GAM GENE, on one or more GAM1985 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[27670] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1985 correlate with, and may be deduced from, the identity of the target genes which GAM1985 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[27671] Nucleotide sequences of the GAM1985 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1985 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1985 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1985 are further described hereinbelow with reference to Table 1.

[27672] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1985 RNA, herein designated GAM RNA, are described hereinbelow

with reference to Table 2.

[27673] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1986 (GAM1986) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[27674] GAM1986 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1986 was detected is described hereinabove with reference to Figs. 2-8.

[27675] GAM1986 gene, herein designated GAM GENE, and GAM1986 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[27676] GAM1986 gene, herein designated GAM GENE, encodes a GAM1986 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1986 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1986 precursor RNA is designated SEQ ID:1963, and is provided hereinbelow with reference to the sequence listing part.

[27677] GAM1986 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1986 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA

encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[27678] An enzyme complex designated DICER COMPLEX, dices the GAM1986 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1986 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 83%) nucleotide sequence of GAM1986 RNA is designated SEQ ID:4572, and is provided hereinbelow with reference to the sequence listing part.

[27679] GAM1986 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1986 target RNA, herein designated GAM TARGET RNA. GAM1986 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[27680] GAM1986 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1986 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1986 RNA,

herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1986 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1986 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[27681] The complementary binding of GAM1986 RNA, herein designated GAM RNA, to target binding sites on GAM1986 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1986 target RNA, herein designated GAM TARGET RNA, into GAM1986 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[27682] It is appreciated that GAM1986 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1986 target genes. The mRNA of each one of this plurality of GAM1986 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1986 RNA, herein designated GAM RNA, and which when bound by GAM1986 RNA, herein designated GAM RNA,

causes inhibition of translation of respective one or more GAM1986 target proteins.

[27683] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1986 gene, herein designated GAM GENE, on one or more GAM1986 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[27684] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1986 correlate with, and may be deduced from, the identity of the target genes which GAM1986 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[27685] Nucleotide sequences of the GAM1986 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1986 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1986 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1986 are further described hereinbelow with reference to Table 1.

[27686] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1986 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[27687] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1987 (GAM1987) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[27688] GAM1987 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1987 was detected is described hereinabove with reference to Figs. 2-8.

[27689] GAM1987 gene, herein designated GAM GENE, and GAM1987 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[27690] GAM1987 gene, herein designated GAM GENE, encodes a GAM1987 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1987 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1987 precursor RNA is designated SEQ ID:1964, and is provided hereinbelow with reference to the sequence listing part.

[27691] GAM1987 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1987 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[27692] An enzyme complex designated DICER COMPLEX, dices the GAM1987 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1987 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 91%) nucleotide sequence of GAM1987 RNA is designated SEQ ID:4571, and is provided hereinbelow with reference to the sequence listing part.

[27693] GAM1987 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1987 target RNA, herein designated GAM TARGET RNA. GAM1987 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[27694] GAM1987 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1987 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1987 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1987 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1987 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[27695] The complementary binding of GAM1987 RNA, herein designated GAM RNA, to target binding sites on GAM1987 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1987 target RNA, herein designated GAM TARGET RNA, into GAM1987 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[27696] It is appreciated that GAM1987 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1987 target genes. The

mRNA of each one of this plurality of GAM1987 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1987 RNA, herein designated GAM RNA, and which when bound by GAM1987 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1987 target proteins.

[27697] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1987 gene, herein designated GAM GENE, on one or more GAM1987 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[27698] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1987 correlate with, and may be deduced from, the identity of the target genes which GAM1987 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[27699] Nucleotide sequences of the GAM1987 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1987 RNA, herein

designated GAM RNA, and a schematic representation of the secondary folding of GAM1987 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1987 are further described hereinbelow with reference to Table 1.

[27700] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1987 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[27701] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1988 (GAM1988) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[27702] GAM1988 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1988 was detected is described hereinabove with reference to Figs. 2-8.

[27703] GAM1988 gene, herein designated GAM GENE, and GAM1988 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[27704] GAM1988 gene, herein designated GAM GENE, encodes a GAM1988 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1988 precursor RNA,

herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1988 precursor RNA is designated SEQ ID:1965, and is provided hereinbelow with reference to the sequence listing part.

[27705] GAM1988 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1988 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[27706] An enzyme complex designated DICER COMPLEX, dices the GAM1988 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1988 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 89%) nucleotide sequence of GAM1988 RNA is designated SEQ ID:4573, and is provided hereinbelow with reference to the sequence listing part.

[27707] GAM1988 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1988 target RNA, herein designated GAM TARGET RNA. GAM1988 target RNA, herein designated GAM

TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[27708] GAM1988 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1988 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1988 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1988 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1988 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[27709] The complementary binding of GAM1988 RNA, herein designated GAM RNA, to target binding sites on GAM1988 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1988 target RNA, herein designated GAM TARGET RNA, into GAM1988 target protein, herein

designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[27710] It is appreciated that GAM1988 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1988 target genes. The mRNA of each one of this plurality of GAM1988 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1988 RNA, herein designated GAM RNA, and which when bound by GAM1988 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1988 target proteins.

[27711] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1988 gene, herein designated GAM GENE, on one or more GAM1988 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[27712] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1988 correlate with, and may be deduced from, the identity of the target

genes which GAM1988 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[27713] Nucleotide sequences of the GAM1988 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1988 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1988 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1988 are further described hereinbelow with reference to Table 1.

[27714] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1988 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[27715] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1989 (GAM1989) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[27716] GAM1989 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1989 was detected is described hereinabove with reference to Figs. 2-8.

[27717] GAM1989 gene, herein designated GAM GENE, and GAM1989 target gene, herein designated GAM TARGET GENE, are human genes contained in the

human genome.

[27718] GAM1989 gene, herein designated GAM GENE, encodes a GAM1989 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1989 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1989 precursor RNA is designated SEQ ID:1966, and is provided hereinbelow with reference to the sequence listing part.

[27719] GAM1989 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1989 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[27720] An enzyme complex designated DICER COMPLEX, dices the GAM1989 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1989 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 82%) nucleotide sequence of GAM1989 RNA is designated SEQ ID:4574, and is provided

hereinbelow with reference to the sequence listing part.

[27721] GAM1989 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1989 target RNA, herein designated GAM TARGET RNA. GAM1989 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[27722] GAM1989 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1989 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1989 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1989 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1989 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[27723] The complementary binding of GAM1989 RNA, herein designated GAM RNA, to target binding sites on GAM1989 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1989 target RNA, herein designated GAM TARGET RNA, into GAM1989 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[27724] It is appreciated that GAM1989 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1989 target genes. The mRNA of each one of this plurality of GAM1989 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1989 RNA, herein designated GAM RNA, and which when bound by GAM1989 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1989 target proteins.

[27725] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1989 gene, herein designated GAM GENE, on one or more GAM1989 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding

sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[27726] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1989 correlate with, and may be deduced from, the identity of the target genes which GAM1989 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[27727] Nucleotide sequences of the GAM1989 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1989 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1989 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1989 are further described hereinbelow with reference to Table 1.

[27728] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1989 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[27729] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1990 (GAM1990) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[27730] GAM1990 is a novel bioinformatically detected regulatory, non protein

coding, micro RNA (miRNA) gene. The method by which GAM1990 was detected is described hereinabove with reference to Figs. 2-8.

[27731] GAM1990 gene, herein designated GAM GENE, and GAM1990 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[27732] GAM1990 gene, herein designated GAM GENE, encodes a GAM1990 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1990 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1990 precursor RNA is designated SEQ ID:1967, and is provided hereinbelow with reference to the sequence listing part.

[27733] GAM1990 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1990 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[27734] An enzyme complex designated DICER COMPLEX, dices the GAM1990 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1990 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin

structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 82%) nucleotide sequence of GAM1990 RNA is designated SEQ ID:4575, and is provided hereinbelow with reference to the sequence listing part.

[27735] GAM1990 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1990 target RNA, herein designated GAM TARGET RNA. GAM1990 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[27736] GAM1990 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1990 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1990 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1990 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1990 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target

binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[27737] The complementary binding of GAM1990 RNA, herein designated GAM RNA, to target binding sites on GAM1990 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1990 target RNA, herein designated GAM TARGET RNA, into GAM1990 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[27738] It is appreciated that GAM1990 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1990 target genes. The mRNA of each one of this plurality of GAM1990 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1990 RNA, herein designated GAM RNA, and which when bound by GAM1990 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1990 target proteins.

[27739] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1990 gene, herein designated GAM GENE, on one or more GAM1990 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary

binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[27740] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1990 correlate with, and may be deduced from, the identity of the target genes which GAM1990 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[27741] Nucleotide sequences of the GAM1990 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1990 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1990 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1990 are further described hereinbelow with reference to Table 1.

[27742] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1990 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[27743] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1991 (GAM1991) gene, which modulates

expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[27744] GAM1991 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1991 was detected is described hereinabove with reference to Figs. 2-8.

[27745] GAM1991 gene, herein designated GAM GENE, and GAM1991 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[27746] GAM1991 gene, herein designated GAM GENE, encodes a GAM1991 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1991 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1991 precursor RNA is designated SEQ ID:1968, and is provided hereinbelow with reference to the sequence listing part.

[27747] GAM1991 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1991 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[27748] An enzyme complex designated DICER COMPLEX, dices the GAM1991 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1991 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 87%) nucleotide sequence of GAM1991 RNA is designated SEQ ID:4576, and is provided hereinbelow with reference to the sequence listing part.

[27749] GAM1991 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1991 target RNA, herein designated GAM TARGET RNA. GAM1991 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[27750] GAM1991 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1991 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1991 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an

illustration only, and is not meant to be limiting GAM1991 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1991 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[27751] The complementary binding of GAM1991 RNA, herein designated GAM RNA, to target binding sites on GAM1991 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1991 target RNA, herein designated GAM TARGET RNA, into GAM1991 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[27752] It is appreciated that GAM1991 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1991 target genes. The mRNA of each one of this plurality of GAM1991 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1991 RNA, herein designated GAM RNA, and which when bound by GAM1991 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1991 target proteins.

[27753] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition

exerted by GAM1991 gene, herein designated GAM GENE, on one or more GAM1991 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[27754] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1991 correlate with, and may be deduced from, the identity of the target genes which GAM1991 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[27755] Nucleotide sequences of the GAM1991 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1991 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1991 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1991 are further described hereinbelow with reference to Table 1.

[27756] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1991 RNA, herein designated GAM RNA, are described hereinbelow

with reference to Table 2.

[27757] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1992 (GAM1992) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[27758] GAM1992 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1992 was detected is described hereinabove with reference to Figs. 2-8.

[27759] GAM1992 gene, herein designated GAM GENE, and GAM1992 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[27760] GAM1992 gene, herein designated GAM GENE, encodes a GAM1992 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1992 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1992 precursor RNA is designated SEQ ID:1969, and is provided hereinbelow with reference to the sequence listing part.

[27761] GAM1992 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1992 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA

encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[27762] An enzyme complex designated DICER COMPLEX, dices the GAM1992 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1992 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 86%) nucleotide sequence of GAM1992 RNA is designated SEQ ID:4577, and is provided hereinbelow with reference to the sequence listing part.

[27763] GAM1992 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1992 target RNA, herein designated GAM TARGET RNA. GAM1992 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[27764] GAM1992 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1992 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1992 RNA,

herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1992 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1992 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[27765] The complementary binding of GAM1992 RNA, herein designated GAM RNA, to target binding sites on GAM1992 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1992 target RNA, herein designated GAM TARGET RNA, into GAM1992 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[27766] It is appreciated that GAM1992 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1992 target genes. The mRNA of each one of this plurality of GAM1992 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1992 RNA, herein designated GAM RNA, and which when bound by GAM1992 RNA, herein designated GAM RNA,

causes inhibition of translation of respective one or more GAM1992 target proteins.

[27767] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1992 gene, herein designated GAM GENE, on one or more GAM1992 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[27768] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1992 correlate with, and may be deduced from, the identity of the target genes which GAM1992 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[27769] Nucleotide sequences of the GAM1992 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1992 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1992 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1992 are further described hereinbelow with reference to Table 1.

[27770] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1992 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[27771] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1993 (GAM1993) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[27772] GAM1993 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1993 was detected is described hereinabove with reference to Figs. 2-8.

[27773] GAM1993 gene, herein designated GAM GENE, and GAM1993 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[27774] GAM1993 gene, herein designated GAM GENE, encodes a GAM1993 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1993 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1993 precursor RNA is designated SEQ ID:1970, and is provided hereinbelow with reference to the sequence listing part.

[27775] GAM1993 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1993 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[27776] An enzyme complex designated DICER COMPLEX, dices the GAM1993 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1993 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 88%) nucleotide sequence of GAM1993 RNA is designated SEQ ID:4578, and is provided hereinbelow with reference to the sequence listing part.

[27777] GAM1993 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1993 target RNA, herein designated GAM TARGET RNA. GAM1993 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[27778] GAM1993 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1993 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1993 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1993 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1993 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[27779] The complementary binding of GAM1993 RNA, herein designated GAM RNA, to target binding sites on GAM1993 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1993 target RNA, herein designated GAM TARGET RNA, into GAM1993 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[27780] It is appreciated that GAM1993 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1993 target genes. The

mRNA of each one of this plurality of GAM1993 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1993 RNA, herein designated GAM RNA, and which when bound by GAM1993 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1993 target proteins.

[27781] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1993 gene, herein designated GAM GENE, on one or more GAM1993 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[27782] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1993 correlate with, and may be deduced from, the identity of the target genes which GAM1993 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[27783] Nucleotide sequences of the GAM1993 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1993 RNA, herein

designated GAM RNA, and a schematic representation of the secondary folding of GAM1993 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1993 are further described hereinbelow with reference to Table 1.

[27784] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1993 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[27785] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1994 (GAM1994) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[27786] GAM1994 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1994 was detected is described hereinabove with reference to Figs. 2-8.

[27787] GAM1994 gene, herein designated GAM GENE, and GAM1994 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[27788] GAM1994 gene, herein designated GAM GENE, encodes a GAM1994 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1994 precursor RNA,

herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1994 precursor RNA is designated SEQ ID:1971, and is provided hereinbelow with reference to the sequence listing part.

[27789] GAM1994 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1994 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[27790] An enzyme complex designated DICER COMPLEX, dices the GAM1994 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1994 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 80%) nucleotide sequence of GAM1994 RNA is designated SEQ ID:4579, and is provided hereinbelow with reference to the sequence listing part.

[27791] GAM1994 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1994 target RNA, herein designated GAM TARGET RNA. GAM1994 target RNA, herein designated GAM

TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[27792] GAM1994 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1994 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1994 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1994 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1994 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[27793] The complementary binding of GAM1994 RNA, herein designated GAM RNA, to target binding sites on GAM1994 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1994 target RNA, herein designated GAM TARGET RNA, into GAM1994 target protein, herein

designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[27794] It is appreciated that GAM1994 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1994 target genes. The mRNA of each one of this plurality of GAM1994 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1994 RNA, herein designated GAM RNA, and which when bound by GAM1994 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1994 target proteins.

[27795] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1994 gene, herein designated GAM GENE, on one or more GAM1994 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[27796] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1994 correlate with, and may be deduced from, the identity of the target

genes which GAM1994 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[27797] Nucleotide sequences of the GAM1994 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1994 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1994 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1994 are further described hereinbelow with reference to Table 1.

[27798] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1994 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[27799] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1995 (GAM1995) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[27800] GAM1995 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1995 was detected is described hereinabove with reference to Figs. 2-8.

[27801] GAM1995 gene, herein designated GAM GENE, and GAM1995 target gene, herein designated GAM TARGET GENE, are human genes contained in the

human genome.

[27802] GAM1995 gene, herein designated GAM GENE, encodes a GAM1995 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1995 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1995 precursor RNA is designated SEQ ID:1972, and is provided hereinbelow with reference to the sequence listing part.

[27803] GAM1995 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1995 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[27804] An enzyme complex designated DICER COMPLEX, dices the GAM1995 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1995 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 83%) nucleotide sequence of GAM1995 RNA is designated SEQ ID:4581, and is provided

hereinbelow with reference to the sequence listing part.

[27805] GAM1995 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1995 target RNA, herein designated GAM TARGET RNA. GAM1995 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[27806] GAM1995 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1995 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1995 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1995 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1995 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[27807] The complementary binding of GAM1995 RNA, herein designated GAM RNA, to target binding sites on GAM1995 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1995 target RNA, herein designated GAM TARGET RNA, into GAM1995 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[27808] It is appreciated that GAM1995 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1995 target genes. The mRNA of each one of this plurality of GAM1995 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1995 RNA, herein designated GAM RNA, and which when bound by GAM1995 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1995 target proteins.

[27809] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1995 gene, herein designated GAM GENE, on one or more GAM1995 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding

sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[27810] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1995 correlate with, and may be deduced from, the identity of the target genes which GAM1995 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[27811] Nucleotide sequences of the GAM1995 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1995 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1995 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1995 are further described hereinbelow with reference to Table 1.

[27812] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1995 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[27813] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1996 (GAM1996) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[27814] GAM1996 is a novel bioinformatically detected regulatory, non protein

coding, micro RNA (miRNA) gene. The method by which GAM1996 was detected is described hereinabove with reference to Figs. 2-8.

[27815] GAM1996 gene, herein designated GAM GENE, and GAM1996 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[27816] GAM1996 gene, herein designated GAM GENE, encodes a GAM1996 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1996 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1996 precursor RNA is designated SEQ ID:1973, and is provided hereinbelow with reference to the sequence listing part.

[27817] GAM1996 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1996 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[27818] An enzyme complex designated DICER COMPLEX, dices the GAM1996 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1996 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin

structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM1996 RNA is designated SEQ ID:4580, and is provided hereinbelow with reference to the sequence listing part.

[27819] GAM1996 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1996 target RNA, herein designated GAM TARGET RNA. GAM1996 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[27820] GAM1996 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1996 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1996 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1996 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1996 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target

binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[27821] The complementary binding of GAM1996 RNA, herein designated GAM RNA, to target binding sites on GAM1996 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1996 target RNA, herein designated GAM TARGET RNA, into GAM1996 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[27822] It is appreciated that GAM1996 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1996 target genes. The mRNA of each one of this plurality of GAM1996 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1996 RNA, herein designated GAM RNA, and which when bound by GAM1996 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1996 target proteins.

[27823] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1996 gene, herein designated GAM GENE, on one or more GAM1996 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary

binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[27824] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1996 correlate with, and may be deduced from, the identity of the target genes which GAM1996 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[27825] Nucleotide sequences of the GAM1996 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1996 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1996 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1996 are further described hereinbelow with reference to Table 1.

[27826] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1996 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[27827] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1997 (GAM1997) gene, which modulates

expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[27828] GAM1997 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1997 was detected is described hereinabove with reference to Figs. 2-8.

[27829] GAM1997 gene, herein designated GAM GENE, and GAM1997 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[27830] GAM1997 gene, herein designated GAM GENE, encodes a GAM1997 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1997 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1997 precursor RNA is designated SEQ ID:1974, and is provided hereinbelow with reference to the sequence listing part.

[27831] GAM1997 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1997 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[27832] An enzyme complex designated DICER COMPLEX, dices the GAM1997 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1997 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 82%) nucleotide sequence of GAM1997 RNA is designated SEQ ID:4582, and is provided hereinbelow with reference to the sequence listing part.

[27833] GAM1997 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1997 target RNA, herein designated GAM TARGET RNA. GAM1997 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[27834] GAM1997 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1997 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1997 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an

illustration only, and is not meant to be limiting GAM1997 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1997 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[27835] The complementary binding of GAM1997 RNA, herein designated GAM RNA, to target binding sites on GAM1997 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1997 target RNA, herein designated GAM TARGET RNA, into GAM1997 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[27836] It is appreciated that GAM1997 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1997 target genes. The mRNA of each one of this plurality of GAM1997 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1997 RNA, herein designated GAM RNA, and which when bound by GAM1997 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1997 target proteins.

[27837] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition

exerted by GAM1997 gene, herein designated GAM GENE, on one or more GAM1997 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[27838] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1997 correlate with, and may be deduced from, the identity of the target genes which GAM1997 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[27839] Nucleotide sequences of the GAM1997 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1997 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1997 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1997 are further described hereinbelow with reference to Table 1.

[27840] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1997 RNA, herein designated GAM RNA, are described hereinbelow

with reference to Table 2.

[27841] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1998 (GAM1998) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[27842] GAM1998 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1998 was detected is described hereinabove with reference to Figs. 2-8.

[27843] GAM1998 gene, herein designated GAM GENE, and GAM1998 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[27844] GAM1998 gene, herein designated GAM GENE, encodes a GAM1998 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1998 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1998 precursor RNA is designated SEQ ID:1975, and is provided hereinbelow with reference to the sequence listing part.

[27845] GAM1998 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1998 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA

encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[27846] An enzyme complex designated DICER COMPLEX, dices the GAM1998 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1998 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 83%) nucleotide sequence of GAM1998 RNA is designated SEQ ID:4586, and is provided hereinbelow with reference to the sequence listing part.

[27847] GAM1998 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1998 target RNA, herein designated GAM TARGET RNA. GAM1998 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[27848] GAM1998 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1998 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1998 RNA,

herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1998 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1998 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[27849] The complementary binding of GAM1998 RNA, herein designated GAM RNA, to target binding sites on GAM1998 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1998 target RNA, herein designated GAM TARGET RNA, into GAM1998 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[27850] It is appreciated that GAM1998 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1998 target genes. The mRNA of each one of this plurality of GAM1998 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1998 RNA, herein designated GAM RNA, and which when bound by GAM1998 RNA, herein designated GAM RNA,

causes inhibition of translation of respective one or more GAM1998 target proteins.

[27851] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1998 gene, herein designated GAM GENE, on one or more GAM1998 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[27852] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1998 correlate with, and may be deduced from, the identity of the target genes which GAM1998 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[27853] Nucleotide sequences of the GAM1998 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1998 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1998 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1998 are further described hereinbelow with reference to Table 1.

[27854] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1998 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[27855] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1999 (GAM1999) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[27856] GAM1999 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1999 was detected is described hereinabove with reference to Figs. 2-8.

[27857] GAM1999 gene, herein designated GAM GENE, and GAM1999 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[27858] GAM1999 gene, herein designated GAM GENE, encodes a GAM1999 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1999 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1999 precursor RNA is designated SEQ ID:1976, and is provided hereinbelow with reference to the sequence listing part.

[27859] GAM1999 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1999 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[27860] An enzyme complex designated DICER COMPLEX, dices the GAM1999 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1999 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 80%) nucleotide sequence of GAM1999 RNA is designated SEQ ID:4587, and is provided hereinbelow with reference to the sequence listing part.

[27861] GAM1999 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1999 target RNA, herein designated GAM TARGET RNA. GAM1999 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[27862] GAM1999 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1999 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1999 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1999 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1999 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[27863] The complementary binding of GAM1999 RNA, herein designated GAM RNA, to target binding sites on GAM1999 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1999 target RNA, herein designated GAM TARGET RNA, into GAM1999 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[27864] It is appreciated that GAM1999 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1999 target genes. The

mRNA of each one of this plurality of GAM1999 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1999 RNA, herein designated GAM RNA, and which when bound by GAM1999 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1999 target proteins.

[27865] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1999 gene, herein designated GAM GENE, on one or more GAM1999 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[27866] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1999 correlate with, and may be deduced from, the identity of the target genes which GAM1999 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[27867] Nucleotide sequences of the GAM1999 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1999 RNA, herein

designated GAM RNA, and a schematic representation of the secondary folding of GAM1999 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1999 are further described hereinbelow with reference to Table 1.

[27868] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1999 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[27869] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2000 (GAM2000) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[27870] GAM2000 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2000 was detected is described hereinabove with reference to Figs. 2-8.

[27871] GAM2000 gene, herein designated GAM GENE, and GAM2000 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[27872] GAM2000 gene, herein designated GAM GENE, encodes a GAM2000 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2000 precursor RNA,

herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2000 precursor RNA is designated SEQ ID:1977, and is provided hereinbelow with reference to the sequence listing part.

[27873] GAM2000 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2000 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[27874] An enzyme complex designated DICER COMPLEX, dices the GAM2000 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2000 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 78%) nucleotide sequence of GAM2000 RNA is designated SEQ ID:4588, and is provided hereinbelow with reference to the sequence listing part.

[27875] GAM2000 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2000 target RNA, herein designated GAM TARGET RNA. GAM2000 target RNA, herein designated GAM

TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[27876] GAM2000 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2000 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2000 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2000 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2000 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[27877] The complementary binding of GAM2000 RNA, herein designated GAM RNA, to target binding sites on GAM2000 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2000 target RNA, herein designated GAM TARGET RNA, into GAM2000 target protein, herein

designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[27878] It is appreciated that GAM2000 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2000 target genes. The mRNA of each one of this plurality of GAM2000 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2000 RNA, herein designated GAM RNA, and which when bound by GAM2000 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2000 target proteins.

[27879] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2000 gene, herein designated GAM GENE, on one or more GAM2000 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[27880] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2000 correlate with, and may be deduced from, the identity of the target

genes which GAM2000 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[27881] Nucleotide sequences of the GAM2000 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2000 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2000 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2000 are further described hereinbelow with reference to Table 1.

[27882] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2000 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[27883] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2001 (GAM2001) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[27884] GAM2001 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2001 was detected is described hereinabove with reference to Figs. 2-8.

[27885] GAM2001 gene, herein designated GAM GENE, and GAM2001 target gene, herein designated GAM TARGET GENE, are human genes contained in the

human genome.

[27886] GAM2001 gene, herein designated GAM GENE, encodes a GAM2001 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2001 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2001 precursor RNA is designated SEQ ID:1978, and is provided hereinbelow with reference to the sequence listing part.

[27887] GAM2001 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2001 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[27888] An enzyme complex designated DICER COMPLEX, dices the GAM2001 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2001 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 83%) nucleotide sequence of GAM2001 RNA is designated SEQ ID:4589, and is provided

hereinbelow with reference to the sequence listing part.

[27889] GAM2001 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2001 target RNA, herein designated GAM TARGET RNA. GAM2001 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[27890] GAM2001 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2001 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2001 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2001 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2001 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[27891] The complementary binding of GAM2001 RNA, herein designated GAM RNA, to target binding sites on GAM2001 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2001 target RNA, herein designated GAM TARGET RNA, into GAM2001 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[27892] It is appreciated that GAM2001 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2001 target genes. The mRNA of each one of this plurality of GAM2001 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2001 RNA, herein designated GAM RNA, and which when bound by GAM2001 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2001 target proteins.

[27893] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2001 gene, herein designated GAM GENE, on one or more GAM2001 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding

sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[27894] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2001 correlate with, and may be deduced from, the identity of the target genes which GAM2001 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[27895] Nucleotide sequences of the GAM2001 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2001 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2001 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2001 are further described hereinbelow with reference to Table 1.

[27896] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2001 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[27897] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2002 (GAM2002) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[27898] GAM2002 is a novel bioinformatically detected regulatory, non protein

coding, micro RNA (miRNA) gene. The method by which GAM2002 was detected is described hereinabove with reference to Figs. 2-8.

[27899] GAM2002 gene, herein designated GAM GENE, and GAM2002 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[27900] GAM2002 gene, herein designated GAM GENE, encodes a GAM2002 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2002 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2002 precursor RNA is designated SEQ ID:1979, and is provided hereinbelow with reference to the sequence listing part.

[27901] GAM2002 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2002 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[27902] An enzyme complex designated DICER COMPLEX, dices the GAM2002 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2002 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin

structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 82%) nucleotide sequence of GAM2002 RNA is designated SEQ ID:4591, and is provided hereinbelow with reference to the sequence listing part.

[27903] GAM2002 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2002 target RNA, herein designated GAM TARGET RNA. GAM2002 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[27904] GAM2002 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2002 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2002 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2002 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2002 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target

binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[27905] The complementary binding of GAM2002 RNA, herein designated GAM RNA, to target binding sites on GAM2002 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2002 target RNA, herein designated GAM TARGET RNA, into GAM2002 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[27906] It is appreciated that GAM2002 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2002 target genes. The mRNA of each one of this plurality of GAM2002 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2002 RNA, herein designated GAM RNA, and which when bound by GAM2002 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2002 target proteins.

[27907] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2002 gene, herein designated GAM GENE, on one or more GAM2002 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary

binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[27908] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2002 correlate with, and may be deduced from, the identity of the target genes which GAM2002 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[27909] Nucleotide sequences of the GAM2002 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2002 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2002 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2002 are further described hereinbelow with reference to Table 1.

[27910] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2002 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[27911] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2003 (GAM2003) gene, which modulates

expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[27912] GAM2003 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2003 was detected is described hereinabove with reference to Figs. 2-8.

[27913] GAM2003 gene, herein designated GAM GENE, and GAM2003 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[27914] GAM2003 gene, herein designated GAM GENE, encodes a GAM2003 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2003 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2003 precursor RNA is designated SEQ ID:1980, and is provided hereinbelow with reference to the sequence listing part.

[27915] GAM2003 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2003 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[27916] An enzyme complex designated DICER COMPLEX, dices the GAM2003 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2003 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 79%) nucleotide sequence of GAM2003 RNA is designated SEQ ID:4590, and is provided hereinbelow with reference to the sequence listing part.

[27917] GAM2003 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2003 target RNA, herein designated GAM TARGET RNA. GAM2003 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[27918] GAM2003 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2003 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2003 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an

illustration only, and is not meant to be limiting GAM2003 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2003 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[27919] The complementary binding of GAM2003 RNA, herein designated GAM RNA, to target binding sites on GAM2003 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2003 target RNA, herein designated GAM TARGET RNA, into GAM2003 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[27920] It is appreciated that GAM2003 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2003 target genes. The mRNA of each one of this plurality of GAM2003 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2003 RNA, herein designated GAM RNA, and which when bound by GAM2003 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2003 target proteins.

[27921] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition

exerted by GAM2003 gene, herein designated GAM GENE, on one or more GAM2003 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[27922] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2003 correlate with, and may be deduced from, the identity of the target genes which GAM2003 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[27923] Nucleotide sequences of the GAM2003 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2003 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2003 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2003 are further described hereinbelow with reference to Table 1.

[27924] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2003 RNA, herein designated GAM RNA, are described hereinbelow

with reference to Table 2.

[27925] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2004 (GAM2004) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[27926] GAM2004 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2004 was detected is described hereinabove with reference to Figs. 2-8.

[27927] GAM2004 gene, herein designated GAM GENE, and GAM2004 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[27928] GAM2004 gene, herein designated GAM GENE, encodes a GAM2004 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2004 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2004 precursor RNA is designated SEQ ID:1981, and is provided hereinbelow with reference to the sequence listing part.

[27929] GAM2004 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2004 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA

encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[27930] An enzyme complex designated DICER COMPLEX, dices the GAM2004 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2004 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 80%) nucleotide sequence of GAM2004 RNA is designated SEQ ID:4592, and is provided hereinbelow with reference to the sequence listing part.

[27931] GAM2004 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2004 target RNA, herein designated GAM TARGET RNA. GAM2004 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[27932] GAM2004 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2004 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2004 RNA,

herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2004 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2004 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[27933] The complementary binding of GAM2004 RNA, herein designated GAM RNA, to target binding sites on GAM2004 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2004 target RNA, herein designated GAM TARGET RNA, into GAM2004 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[27934] It is appreciated that GAM2004 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2004 target genes. The mRNA of each one of this plurality of GAM2004 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2004 RNA, herein designated GAM RNA, and which when bound by GAM2004 RNA, herein designated GAM RNA,

causes inhibition of translation of respective one or more GAM2004 target proteins.

[27935] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2004 gene, herein designated GAM GENE, on one or more GAM2004 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[27936] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2004 correlate with, and may be deduced from, the identity of the target genes which GAM2004 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[27937] Nucleotide sequences of the GAM2004 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2004 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2004 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2004 are further described hereinbelow with reference to Table 1.

[27938] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2004 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[27939] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2005 (GAM2005) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[27940] GAM2005 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2005 was detected is described hereinabove with reference to Figs. 2-8.

[27941] GAM2005 gene, herein designated GAM GENE, and GAM2005 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[27942] GAM2005 gene, herein designated GAM GENE, encodes a GAM2005 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2005 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2005 precursor RNA is designated SEQ ID:1982, and is provided hereinbelow with reference to the sequence listing part.

[27943] GAM2005 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2005 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[27944] An enzyme complex designated DICER COMPLEX, dices the GAM2005 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2005 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 81%) nucleotide sequence of GAM2005 RNA is designated SEQ ID:4593, and is provided hereinbelow with reference to the sequence listing part.

[27945] GAM2005 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2005 target RNA, herein designated GAM TARGET RNA. GAM2005 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[27946] GAM2005 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2005 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2005 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2005 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2005 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[27947] The complementary binding of GAM2005 RNA, herein designated GAM RNA, to target binding sites on GAM2005 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2005 target RNA, herein designated GAM TARGET RNA, into GAM2005 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[27948] It is appreciated that GAM2005 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2005 target genes. The

mRNA of each one of this plurality of GAM2005 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2005 RNA, herein designated GAM RNA, and which when bound by GAM2005 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2005 target proteins.

[27949] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2005 gene, herein designated GAM GENE, on one or more GAM2005 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[27950] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2005 correlate with, and may be deduced from, the identity of the target genes which GAM2005 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[27951] Nucleotide sequences of the GAM2005 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2005 RNA, herein

designated GAM RNA, and a schematic representation of the secondary folding of GAM2005 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2005 are further described hereinbelow with reference to Table 1.

[27952] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2005 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[27953] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2006 (GAM2006) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[27954] GAM2006 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2006 was detected is described hereinabove with reference to Figs. 2-8.

[27955] GAM2006 gene, herein designated GAM GENE, and GAM2006 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[27956] GAM2006 gene, herein designated GAM GENE, encodes a GAM2006 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2006 precursor RNA,

herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2006 precursor RNA is designated SEQ ID:1983, and is provided hereinbelow with reference to the sequence listing part.

[27957] GAM2006 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2006 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[27958] An enzyme complex designated DICER COMPLEX, dices the GAM2006 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2006 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM2006 RNA is designated SEQ ID:4594, and is provided hereinbelow with reference to the sequence listing part.

[27959] GAM2006 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2006 target RNA, herein designated GAM TARGET RNA. GAM2006 target RNA, herein designated GAM

TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[27960] GAM2006 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2006 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2006 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2006 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2006 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[27961] The complementary binding of GAM2006 RNA, herein designated GAM RNA, to target binding sites on GAM2006 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2006 target RNA, herein designated GAM TARGET RNA, into GAM2006 target protein, herein

designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[27962] It is appreciated that GAM2006 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2006 target genes. The mRNA of each one of this plurality of GAM2006 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2006 RNA, herein designated GAM RNA, and which when bound by GAM2006 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2006 target proteins.

[27963] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2006 gene, herein designated GAM GENE, on one or more GAM2006 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[27964] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2006 correlate with, and may be deduced from, the identity of the target

genes which GAM2006 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[27965] Nucleotide sequences of the GAM2006 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2006 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2006 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2006 are further described hereinbelow with reference to Table 1.

[27966] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2006 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[27967] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2007 (GAM2007) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[27968] GAM2007 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2007 was detected is described hereinabove with reference to Figs. 2-8.

[27969] GAM2007 gene, herein designated GAM GENE, and GAM2007 target gene, herein designated GAM TARGET GENE, are human genes contained in the

human genome.

[27970] GAM2007 gene, herein designated GAM GENE, encodes a GAM2007 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2007 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2007 precursor RNA is designated SEQ ID:1984, and is provided hereinbelow with reference to the sequence listing part.

[27971] GAM2007 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2007 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[27972] An enzyme complex designated DICER COMPLEX, dices the GAM2007 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2007 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 76%) nucleotide sequence of GAM2007 RNA is designated SEQ ID:4595, and is provided

hereinbelow with reference to the sequence listing part.

[27973] GAM2007 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2007 target RNA, herein designated GAM TARGET RNA. GAM2007 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[27974] GAM2007 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2007 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2007 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2007 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2007 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[27975] The complementary binding of GAM2007 RNA, herein designated GAM RNA, to target binding sites on GAM2007 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2007 target RNA, herein designated GAM TARGET RNA, into GAM2007 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[27976] It is appreciated that GAM2007 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2007 target genes. The mRNA of each one of this plurality of GAM2007 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2007 RNA, herein designated GAM RNA, and which when bound by GAM2007 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2007 target proteins.

[27977] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2007 gene, herein designated GAM GENE, on one or more GAM2007 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding

sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[27978] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2007 correlate with, and may be deduced from, the identity of the target genes which GAM2007 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[27979] Nucleotide sequences of the GAM2007 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2007 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2007 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2007 are further described hereinbelow with reference to Table 1.

[27980] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2007 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[27981] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2008 (GAM2008) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[27982] GAM2008 is a novel bioinformatically detected regulatory, non protein

coding, micro RNA (miRNA) gene. The method by which GAM2008 was detected is described hereinabove with reference to Figs. 2-8.

[27983] GAM2008 gene, herein designated GAM GENE, and GAM2008 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[27984] GAM2008 gene, herein designated GAM GENE, encodes a GAM2008 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2008 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2008 precursor RNA is designated SEQ ID:1985, and is provided hereinbelow with reference to the sequence listing part.

[27985] GAM2008 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2008 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[27986] An enzyme complex designated DICER COMPLEX, dices the GAM2008 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2008 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin

structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 78%) nucleotide sequence of GAM2008 RNA is designated SEQ ID:4596, and is provided hereinbelow with reference to the sequence listing part.

[27987] GAM2008 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2008 target RNA, herein designated GAM TARGET RNA. GAM2008 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[27988] GAM2008 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2008 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2008 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2008 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2008 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target

binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[27989] The complementary binding of GAM2008 RNA, herein designated GAM RNA, to target binding sites on GAM2008 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2008 target RNA, herein designated GAM TARGET RNA, into GAM2008 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[27990] It is appreciated that GAM2008 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2008 target genes. The mRNA of each one of this plurality of GAM2008 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2008 RNA, herein designated GAM RNA, and which when bound by GAM2008 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2008 target proteins.

[27991] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2008 gene, herein designated GAM GENE, on one or more GAM2008 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary

binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[27992] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2008 correlate with, and may be deduced from, the identity of the target genes which GAM2008 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[27993] Nucleotide sequences of the GAM2008 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2008 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2008 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2008 are further described hereinbelow with reference to Table 1.

[27994] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2008 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[27995] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2009 (GAM2009) gene, which modulates

expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[27996] GAM2009 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2009 was detected is described hereinabove with reference to Figs. 2-8.

[27997] GAM2009 gene, herein designated GAM GENE, and GAM2009 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[27998] GAM2009 gene, herein designated GAM GENE, encodes a GAM2009 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2009 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2009 precursor RNA is designated SEQ ID:1986, and is provided hereinbelow with reference to the sequence listing part.

[27999] GAM2009 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2009 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[28000] An enzyme complex designated DICER COMPLEX, dices the GAM2009 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2009 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 83%) nucleotide sequence of GAM2009 RNA is designated SEQ ID:4597, and is provided hereinbelow with reference to the sequence listing part.

[28001] GAM2009 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2009 target RNA, herein designated GAM TARGET RNA. GAM2009 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[28002] GAM2009 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2009 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2009 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an

illustration only, and is not meant to be limiting GAM2009 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2009 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[28003] The complementary binding of GAM2009 RNA, herein designated GAM RNA, to target binding sites on GAM2009 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2009 target RNA, herein designated GAM TARGET RNA, into GAM2009 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[28004] It is appreciated that GAM2009 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2009 target genes. The mRNA of each one of this plurality of GAM2009 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2009 RNA, herein designated GAM RNA, and which when bound by GAM2009 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2009 target proteins.

[28005] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition

exerted by GAM2009 gene, herein designated GAM GENE, on one or more GAM2009 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[28006] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2009 correlate with, and may be deduced from, the identity of the target genes which GAM2009 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[28007] Nucleotide sequences of the GAM2009 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2009 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2009 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2009 are further described hereinbelow with reference to Table 1.

[28008] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2009 RNA, herein designated GAM RNA, are described hereinbelow

with reference to Table 2.

[28009] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2010 (GAM2010) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[28010] GAM2010 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2010 was detected is described hereinabove with reference to Figs. 2-8.

[28011] GAM2010 gene, herein designated GAM GENE, and GAM2010 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[28012] GAM2010 gene, herein designated GAM GENE, encodes a GAM2010 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2010 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2010 precursor RNA is designated SEQ ID:1987, and is provided hereinbelow with reference to the sequence listing part.

[28013] GAM2010 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2010 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA

encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[28014] An enzyme complex designated DICER COMPLEX, dices the GAM2010 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2010 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 78%) nucleotide sequence of GAM2010 RNA is designated SEQ ID:4598, and is provided hereinbelow with reference to the sequence listing part.

[28015] GAM2010 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2010 target RNA, herein designated GAM TARGET RNA. GAM2010 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[28016] GAM2010 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2010 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2010 RNA,

herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2010 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2010 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[28017] The complementary binding of GAM2010 RNA, herein designated GAM RNA, to target binding sites on GAM2010 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2010 target RNA, herein designated GAM TARGET RNA, into GAM2010 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[28018] It is appreciated that GAM2010 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2010 target genes. The mRNA of each one of this plurality of GAM2010 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2010 RNA, herein designated GAM RNA, and which when bound by GAM2010 RNA, herein designated GAM RNA,

causes inhibition of translation of respective one or more GAM2010 target proteins.

[28019] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2010 gene, herein designated GAM GENE, on one or more GAM2010 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[28020] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2010 correlate with, and may be deduced from, the identity of the target genes which GAM2010 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[28021] Nucleotide sequences of the GAM2010 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2010 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2010 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2010 are further described hereinbelow with reference to Table 1.

[28022] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2010 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[28023] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2011 (GAM2011) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[28024] GAM2011 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2011 was detected is described hereinabove with reference to Figs. 2-8.

[28025] GAM2011 gene, herein designated GAM GENE, and GAM2011 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[28026] GAM2011 gene, herein designated GAM GENE, encodes a GAM2011 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2011 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2011 precursor RNA is designated SEQ ID:1988, and is provided hereinbelow with reference to the sequence listing part.

[28027] GAM2011 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2011 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[28028] An enzyme complex designated DICER COMPLEX, dices the GAM2011 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2011 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 84%) nucleotide sequence of GAM2011 RNA is designated SEQ ID:4599, and is provided hereinbelow with reference to the sequence listing part.

[28029] GAM2011 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2011 target RNA, herein designated GAM TARGET RNA. GAM2011 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[28030] GAM2011 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2011 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2011 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2011 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2011 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[28031] The complementary binding of GAM2011 RNA, herein designated GAM RNA, to target binding sites on GAM2011 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2011 target RNA, herein designated GAM TARGET RNA, into GAM2011 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[28032] It is appreciated that GAM2011 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2011 target genes. The

mRNA of each one of this plurality of GAM2011 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2011 RNA, herein designated GAM RNA, and which when bound by GAM2011 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2011 target proteins.

[28033] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2011 gene, herein designated GAM GENE, on one or more GAM2011 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[28034] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2011 correlate with, and may be deduced from, the identity of the target genes which GAM2011 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[28035] Nucleotide sequences of the GAM2011 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2011 RNA, herein

designated GAM RNA, and a schematic representation of the secondary folding of GAM2011 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2011 are further described hereinbelow with reference to Table 1.

[28036] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2011 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[28037] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2012 (GAM2012) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[28038] GAM2012 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2012 was detected is described hereinabove with reference to Figs. 2-8.

[28039] GAM2012 gene, herein designated GAM GENE, and GAM2012 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[28040] GAM2012 gene, herein designated GAM GENE, encodes a GAM2012 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2012 precursor RNA,

herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2012 precursor RNA is designated SEQ ID:1989, and is provided hereinbelow with reference to the sequence listing part.

[28041] GAM2012 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2012 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[28042] An enzyme complex designated DICER COMPLEX, dices the GAM2012 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2012 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 90%) nucleotide sequence of GAM2012 RNA is designated SEQ ID:4600, and is provided hereinbelow with reference to the sequence listing part.

[28043] GAM2012 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2012 target RNA, herein designated GAM TARGET RNA. GAM2012 target RNA, herein designated GAM

TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[28044] GAM2012 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2012 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2012 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2012 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2012 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[28045] The complementary binding of GAM2012 RNA, herein designated GAM RNA, to target binding sites on GAM2012 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2012 target RNA, herein designated GAM TARGET RNA, into GAM2012 target protein, herein

designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[28046] It is appreciated that GAM2012 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2012 target genes. The mRNA of each one of this plurality of GAM2012 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2012 RNA, herein designated GAM RNA, and which when bound by GAM2012 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2012 target proteins.

[28047] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2012 gene, herein designated GAM GENE, on one or more GAM2012 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[28048] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2012 correlate with, and may be deduced from, the identity of the target

genes which GAM2012 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[28049] Nucleotide sequences of the GAM2012 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2012 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2012 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2012 are further described hereinbelow with reference to Table 1.

[28050] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2012 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[28051] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2013 (GAM2013) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[28052] GAM2013 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2013 was detected is described hereinabove with reference to Figs. 2-8.

[28053] GAM2013 gene, herein designated GAM GENE, and GAM2013 target gene, herein designated GAM TARGET GENE, are human genes contained in the

human genome.

[28054] GAM2013 gene, herein designated GAM GENE, encodes a GAM2013 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2013 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2013 precursor RNA is designated SEQ ID:1990, and is provided hereinbelow with reference to the sequence listing part.

[28055] GAM2013 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2013 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[28056] An enzyme complex designated DICER COMPLEX, dices the GAM2013 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2013 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 25%) nucleotide sequence of GAM2013 RNA is designated SEQ ID:4601, and is provided

hereinbelow with reference to the sequence listing part.

[28057] GAM2013 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2013 target RNA, herein designated GAM TARGET RNA. GAM2013 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[28058] GAM2013 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2013 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2013 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2013 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2013 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[28059] The complementary binding of GAM2013 RNA, herein designated GAM RNA, to target binding sites on GAM2013 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2013 target RNA, herein designated GAM TARGET RNA, into GAM2013 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[28060] It is appreciated that GAM2013 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2013 target genes. The mRNA of each one of this plurality of GAM2013 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2013 RNA, herein designated GAM RNA, and which when bound by GAM2013 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2013 target proteins.

[28061] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2013 gene, herein designated GAM GENE, on one or more GAM2013 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding

sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[28062] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2013 correlate with, and may be deduced from, the identity of the target genes which GAM2013 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[28063] Nucleotide sequences of the GAM2013 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2013 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2013 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2013 are further described hereinbelow with reference to Table 1.

[28064] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2013 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[28065] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2014 (GAM2014) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[28066] GAM2014 is a novel bioinformatically detected regulatory, non protein

coding, micro RNA (miRNA) gene. The method by which GAM2014 was detected is described hereinabove with reference to Figs. 2-8.

[28067] GAM2014 gene, herein designated GAM GENE, and GAM2014 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[28068] GAM2014 gene, herein designated GAM GENE, encodes a GAM2014 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2014 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2014 precursor RNA is designated SEQ ID:1991, and is provided hereinbelow with reference to the sequence listing part.

[28069] GAM2014 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2014 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[28070] An enzyme complex designated DICER COMPLEX, dices the GAM2014 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2014 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin

structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 84%) nucleotide sequence of GAM2014 RNA is designated SEQ ID:4602, and is provided hereinbelow with reference to the sequence listing part.

[28071] GAM2014 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2014 target RNA, herein designated GAM TARGET RNA. GAM2014 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[28072] GAM2014 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2014 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2014 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2014 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2014 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target

binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[28073] The complementary binding of GAM2014 RNA, herein designated GAM RNA, to target binding sites on GAM2014 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2014 target RNA, herein designated GAM TARGET RNA, into GAM2014 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[28074] It is appreciated that GAM2014 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2014 target genes. The mRNA of each one of this plurality of GAM2014 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2014 RNA, herein designated GAM RNA, and which when bound by GAM2014 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2014 target proteins.

[28075] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2014 gene, herein designated GAM GENE, on one or more GAM2014 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary

binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[28076] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2014 correlate with, and may be deduced from, the identity of the target genes which GAM2014 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[28077] Nucleotide sequences of the GAM2014 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2014 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2014 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2014 are further described hereinbelow with reference to Table 1.

[28078] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2014 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[28079] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2015 (GAM2015) gene, which modulates

expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[28080] GAM2015 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2015 was detected is described hereinabove with reference to Figs. 2-8.

[28081] GAM2015 gene, herein designated GAM GENE, and GAM2015 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[28082] GAM2015 gene, herein designated GAM GENE, encodes a GAM2015 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2015 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2015 precursor RNA is designated SEQ ID:1992, and is provided hereinbelow with reference to the sequence listing part.

[28083] GAM2015 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2015 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[28084] An enzyme complex designated DICER COMPLEX, dices the GAM2015 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2015 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 82%) nucleotide sequence of GAM2015 RNA is designated SEQ ID:4603, and is provided hereinbelow with reference to the sequence listing part.

[28085] GAM2015 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2015 target RNA, herein designated GAM TARGET RNA. GAM2015 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[28086] GAM2015 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2015 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2015 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an

illustration only, and is not meant to be limiting GAM2015 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2015 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[28087] The complementary binding of GAM2015 RNA, herein designated GAM RNA, to target binding sites on GAM2015 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2015 target RNA, herein designated GAM TARGET RNA, into GAM2015 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[28088] It is appreciated that GAM2015 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2015 target genes. The mRNA of each one of this plurality of GAM2015 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2015 RNA, herein designated GAM RNA, and which when bound by GAM2015 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2015 target proteins.

[28089] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition

exerted by GAM2015 gene, herein designated GAM GENE, on one or more GAM2015 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[28090] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2015 correlate with, and may be deduced from, the identity of the target genes which GAM2015 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[28091] Nucleotide sequences of the GAM2015 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2015 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2015 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2015 are further described hereinbelow with reference to Table 1.

[28092] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2015 RNA, herein designated GAM RNA, are described hereinbelow

with reference to Table 2.

[28093] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2016 (GAM2016) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[28094] GAM2016 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2016 was detected is described hereinabove with reference to Figs. 2-8.

[28095] GAM2016 gene, herein designated GAM GENE, and GAM2016 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[28096] GAM2016 gene, herein designated GAM GENE, encodes a GAM2016 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2016 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2016 precursor RNA is designated SEQ ID:1993, and is provided hereinbelow with reference to the sequence listing part.

[28097] GAM2016 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2016 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA

encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[28098] An enzyme complex designated DICER COMPLEX, dices the GAM2016 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2016 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 90%) nucleotide sequence of GAM2016 RNA is designated SEQ ID:4604, and is provided hereinbelow with reference to the sequence listing part.

[28099] GAM2016 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2016 target RNA, herein designated GAM TARGET RNA. GAM2016 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[28100] GAM2016 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2016 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2016 RNA,

herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2016 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2016 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[28101] The complementary binding of GAM2016 RNA, herein designated GAM RNA, to target binding sites on GAM2016 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2016 target RNA, herein designated GAM TARGET RNA, into GAM2016 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[28102] It is appreciated that GAM2016 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2016 target genes. The mRNA of each one of this plurality of GAM2016 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2016 RNA, herein designated GAM RNA, and which when bound by GAM2016 RNA, herein designated GAM RNA,

causes inhibition of translation of respective one or more GAM2016 target proteins.

[28103] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2016 gene, herein designated GAM GENE, on one or more GAM2016 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[28104] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2016 correlate with, and may be deduced from, the identity of the target genes which GAM2016 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[28105] Nucleotide sequences of the GAM2016 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2016 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2016 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2016 are further described hereinbelow with reference to Table 1.

[28106] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2016 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[28107] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2017 (GAM2017) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[28108] GAM2017 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2017 was detected is described hereinabove with reference to Figs. 2-8.

[28109] GAM2017 gene, herein designated GAM GENE, and GAM2017 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[28110] GAM2017 gene, herein designated GAM GENE, encodes a GAM2017 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2017 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2017 precursor RNA is designated SEQ ID:1994, and is provided hereinbelow with reference to the sequence listing part.

[28111] GAM2017 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2017 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[28112] An enzyme complex designated DICER COMPLEX, dices the GAM2017 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2017 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM2017 RNA is designated SEQ ID:4605, and is provided hereinbelow with reference to the sequence listing part.

[28113] GAM2017 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2017 target RNA, herein designated GAM TARGET RNA. GAM2017 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[28114] GAM2017 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2017 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2017 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2017 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2017 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[28115] The complementary binding of GAM2017 RNA, herein designated GAM RNA, to target binding sites on GAM2017 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2017 target RNA, herein designated GAM TARGET RNA, into GAM2017 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[28116] It is appreciated that GAM2017 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2017 target genes. The

mRNA of each one of this plurality of GAM2017 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2017 RNA, herein designated GAM RNA, and which when bound by GAM2017 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2017 target proteins.

[28117] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2017 gene, herein designated GAM GENE, on one or more GAM2017 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[28118] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2017 correlate with, and may be deduced from, the identity of the target genes which GAM2017 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[28119] Nucleotide sequences of the GAM2017 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2017 RNA, herein

designated GAM RNA, and a schematic representation of the secondary folding of GAM2017 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2017 are further described hereinbelow with reference to Table 1.

[28120] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2017 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[28121] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2018 (GAM2018) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[28122] GAM2018 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2018 was detected is described hereinabove with reference to Figs. 2-8.

[28123] GAM2018 gene, herein designated GAM GENE, and GAM2018 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[28124] GAM2018 gene, herein designated GAM GENE, encodes a GAM2018 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2018 precursor RNA,

herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2018 precursor RNA is designated SEQ ID:1995, and is provided hereinbelow with reference to the sequence listing part.

[28125] GAM2018 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2018 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[28126] An enzyme complex designated DICER COMPLEX, dices the GAM2018 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2018 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 82%) nucleotide sequence of GAM2018 RNA is designated SEQ ID:4606, and is provided hereinbelow with reference to the sequence listing part.

[28127] GAM2018 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2018 target RNA, herein designated GAM TARGET RNA. GAM2018 target RNA, herein designated GAM

TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[28128] GAM2018 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2018 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2018 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2018 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2018 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[28129] The complementary binding of GAM2018 RNA, herein designated GAM RNA, to target binding sites on GAM2018 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2018 target RNA, herein designated GAM TARGET RNA, into GAM2018 target protein, herein

designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[28130] It is appreciated that GAM2018 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2018 target genes. The mRNA of each one of this plurality of GAM2018 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2018 RNA, herein designated GAM RNA, and which when bound by GAM2018 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2018 target proteins.

[28131] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2018 gene, herein designated GAM GENE, on one or more GAM2018 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[28132] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2018 correlate with, and may be deduced from, the identity of the target

genes which GAM2018 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[28133] Nucleotide sequences of the GAM2018 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2018 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2018 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2018 are further described hereinbelow with reference to Table 1.

[28134] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2018 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[28135] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2019 (GAM2019) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[28136] GAM2019 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2019 was detected is described hereinabove with reference to Figs. 2-8.

[28137] GAM2019 gene, herein designated GAM GENE, and GAM2019 target gene, herein designated GAM TARGET GENE, are human genes contained in the

human genome.

[28138] GAM2019 gene, herein designated GAM GENE, encodes a GAM2019 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2019 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2019 precursor RNA is designated SEQ ID:1996, and is provided hereinbelow with reference to the sequence listing part.

[28139] GAM2019 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2019 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[28140] An enzyme complex designated DICER COMPLEX, dices the GAM2019 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2019 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 79%) nucleotide sequence of GAM2019 RNA is designated SEQ ID:4607, and is provided

hereinbelow with reference to the sequence listing part.

[28141] GAM2019 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2019 target RNA, herein designated GAM TARGET RNA. GAM2019 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[28142] GAM2019 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2019 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2019 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2019 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2019 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[28143] The complementary binding of GAM2019 RNA, herein designated GAM RNA, to target binding sites on GAM2019 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2019 target RNA, herein designated GAM TARGET RNA, into GAM2019 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[28144] It is appreciated that GAM2019 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2019 target genes. The mRNA of each one of this plurality of GAM2019 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2019 RNA, herein designated GAM RNA, and which when bound by GAM2019 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2019 target proteins.

[28145] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2019 gene, herein designated GAM GENE, on one or more GAM2019 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding

sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[28146] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2019 correlate with, and may be deduced from, the identity of the target genes which GAM2019 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[28147] Nucleotide sequences of the GAM2019 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2019 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2019 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2019 are further described hereinbelow with reference to Table 1.

[28148] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2019 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[28149] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2020 (GAM2020) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[28150] GAM2020 is a novel bioinformatically detected regulatory, non protein

coding, micro RNA (miRNA) gene. The method by which GAM2020 was detected is described hereinabove with reference to Figs. 2-8.

[28151] GAM2020 gene, herein designated GAM GENE, and GAM2020 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[28152] GAM2020 gene, herein designated GAM GENE, encodes a GAM2020 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2020 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2020 precursor RNA is designated SEQ ID:1997, and is provided hereinbelow with reference to the sequence listing part.

[28153] GAM2020 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2020 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[28154] An enzyme complex designated DICER COMPLEX, dices the GAM2020 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2020 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin

structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 82%) nucleotide sequence of GAM2020 RNA is designated SEQ ID:4608, and is provided hereinbelow with reference to the sequence listing part.

[28155] GAM2020 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2020 target RNA, herein designated GAM TARGET RNA. GAM2020 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[28156] GAM2020 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2020 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2020 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2020 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2020 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target

binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[28157] The complementary binding of GAM2020 RNA, herein designated GAM RNA, to target binding sites on GAM2020 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2020 target RNA, herein designated GAM TARGET RNA, into GAM2020 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[28158] It is appreciated that GAM2020 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2020 target genes. The mRNA of each one of this plurality of GAM2020 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2020 RNA, herein designated GAM RNA, and which when bound by GAM2020 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2020 target proteins.

[28159] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2020 gene, herein designated GAM GENE, on one or more GAM2020 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary

binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[28160] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2020 correlate with, and may be deduced from, the identity of the target genes which GAM2020 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[28161] Nucleotide sequences of the GAM2020 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2020 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2020 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2020 are further described hereinbelow with reference to Table 1.

[28162] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2020 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[28163] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2021 (GAM2021) gene, which modulates

expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[28164] GAM2021 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2021 was detected is described hereinabove with reference to Figs. 2-8.

[28165] GAM2021 gene, herein designated GAM GENE, and GAM2021 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[28166] GAM2021 gene, herein designated GAM GENE, encodes a GAM2021 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2021 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2021 precursor RNA is designated SEQ ID:1998, and is provided hereinbelow with reference to the sequence listing part.

[28167] GAM2021 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2021 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[28168] An enzyme complex designated DICER COMPLEX, dices the GAM2021 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2021 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 76%) nucleotide sequence of GAM2021 RNA is designated SEQ ID:4609, and is provided hereinbelow with reference to the sequence listing part.

[28169] GAM2021 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2021 target RNA, herein designated GAM TARGET RNA. GAM2021 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[28170] GAM2021 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2021 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2021 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an

illustration only, and is not meant to be limiting GAM2021 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2021 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[28171] The complementary binding of GAM2021 RNA, herein designated GAM RNA, to target binding sites on GAM2021 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2021 target RNA, herein designated GAM TARGET RNA, into GAM2021 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[28172] It is appreciated that GAM2021 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2021 target genes. The mRNA of each one of this plurality of GAM2021 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2021 RNA, herein designated GAM RNA, and which when bound by GAM2021 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2021 target proteins.

[28173] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition

exerted by GAM2021 gene, herein designated GAM GENE, on one or more GAM2021 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[28174] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2021 correlate with, and may be deduced from, the identity of the target genes which GAM2021 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[28175] Nucleotide sequences of the GAM2021 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2021 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2021 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2021 are further described hereinbelow with reference to Table 1.

[28176] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2021 RNA, herein designated GAM RNA, are described hereinbelow

with reference to Table 2.

[28177] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2022 (GAM2022) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[28178] GAM2022 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2022 was detected is described hereinabove with reference to Figs. 2-8.

[28179] GAM2022 gene, herein designated GAM GENE, and GAM2022 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[28180] GAM2022 gene, herein designated GAM GENE, encodes a GAM2022 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2022 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2022 precursor RNA is designated SEQ ID:1999, and is provided hereinbelow with reference to the sequence listing part.

[28181] GAM2022 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2022 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA

encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[28182] An enzyme complex designated DICER COMPLEX, dices the GAM2022 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2022 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM2022 RNA is designated SEQ ID:4611, and is provided hereinbelow with reference to the sequence listing part.

[28183] GAM2022 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2022 target RNA, herein designated GAM TARGET RNA. GAM2022 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[28184] GAM2022 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2022 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2022 RNA,

herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2022 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2022 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[28185] The complementary binding of GAM2022 RNA, herein designated GAM RNA, to target binding sites on GAM2022 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2022 target RNA, herein designated GAM TARGET RNA, into GAM2022 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[28186] It is appreciated that GAM2022 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2022 target genes. The mRNA of each one of this plurality of GAM2022 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2022 RNA, herein designated GAM RNA, and which when bound by GAM2022 RNA, herein designated GAM RNA,

causes inhibition of translation of respective one or more GAM2022 target proteins.

[28187] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2022 gene, herein designated GAM GENE, on one or more GAM2022 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[28188] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2022 correlate with, and may be deduced from, the identity of the target genes which GAM2022 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[28189] Nucleotide sequences of the GAM2022 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2022 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2022 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2022 are further described hereinbelow with reference to Table 1.

[28190] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2022 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[28191] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2023 (GAM2023) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[28192] GAM2023 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2023 was detected is described hereinabove with reference to Figs. 2-8.

[28193] GAM2023 gene, herein designated GAM GENE, and GAM2023 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[28194] GAM2023 gene, herein designated GAM GENE, encodes a GAM2023 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2023 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2023 precursor RNA is designated SEQ ID:2000, and is provided hereinbelow with reference to the sequence listing part.

[28195] GAM2023 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2023 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[28196] An enzyme complex designated DICER COMPLEX, dices the GAM2023 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2023 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 82%) nucleotide sequence of GAM2023 RNA is designated SEQ ID:4610, and is provided hereinbelow with reference to the sequence listing part.

[28197] GAM2023 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2023 target RNA, herein designated GAM TARGET RNA. GAM2023 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[28198] GAM2023 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2023 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2023 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2023 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2023 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[28199] The complementary binding of GAM2023 RNA, herein designated GAM RNA, to target binding sites on GAM2023 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2023 target RNA, herein designated GAM TARGET RNA, into GAM2023 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[28200] It is appreciated that GAM2023 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2023 target genes. The

mRNA of each one of this plurality of GAM2023 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2023 RNA, herein designated GAM RNA, and which when bound by GAM2023 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2023 target proteins.

[28201] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2023 gene, herein designated GAM GENE, on one or more GAM2023 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[28202] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2023 correlate with, and may be deduced from, the identity of the target genes which GAM2023 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[28203] Nucleotide sequences of the GAM2023 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2023 RNA, herein

designated GAM RNA, and a schematic representation of the secondary folding of GAM2023 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2023 are further described hereinbelow with reference to Table 1.

[28204] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2023 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[28205] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2024 (GAM2024) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[28206] GAM2024 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2024 was detected is described hereinabove with reference to Figs. 2-8.

[28207] GAM2024 gene, herein designated GAM GENE, and GAM2024 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[28208] GAM2024 gene, herein designated GAM GENE, encodes a GAM2024 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2024 precursor RNA,

herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2024 precursor RNA is designated SEQ ID:2001, and is provided hereinbelow with reference to the sequence listing part.

[28209] GAM2024 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2024 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[28210] An enzyme complex designated DICER COMPLEX, dices the GAM2024 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2024 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 87%) nucleotide sequence of GAM2024 RNA is designated SEQ ID:4612, and is provided hereinbelow with reference to the sequence listing part.

[28211] GAM2024 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2024 target RNA, herein designated GAM TARGET RNA. GAM2024 target RNA, herein designated GAM

TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[28212] GAM2024 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2024 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2024 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2024 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2024 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[28213] The complementary binding of GAM2024 RNA, herein designated GAM RNA, to target binding sites on GAM2024 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2024 target RNA, herein designated GAM TARGET RNA, into GAM2024 target protein, herein

designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[28214] It is appreciated that GAM2024 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2024 target genes. The mRNA of each one of this plurality of GAM2024 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2024 RNA, herein designated GAM RNA, and which when bound by GAM2024 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2024 target proteins.

[28215] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2024 gene, herein designated GAM GENE, on one or more GAM2024 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[28216] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2024 correlate with, and may be deduced from, the identity of the target

genes which GAM2024 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[28217] Nucleotide sequences of the GAM2024 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2024 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2024 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2024 are further described hereinbelow with reference to Table 1.

[28218] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2024 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[28219] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2025 (GAM2025) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[28220] GAM2025 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2025 was detected is described hereinabove with reference to Figs. 2-8.

[28221] GAM2025 gene, herein designated GAM GENE, and GAM2025 target gene, herein designated GAM TARGET GENE, are human genes contained in the

human genome.

[28222] GAM2025 gene, herein designated GAM GENE, encodes a GAM2025 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2025 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2025 precursor RNA is designated SEQ ID:2002, and is provided hereinbelow with reference to the sequence listing part.

[28223] GAM2025 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2025 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[28224] An enzyme complex designated DICER COMPLEX, dices the GAM2025 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2025 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 84%) nucleotide sequence of GAM2025 RNA is designated SEQ ID:4613, and is provided

hereinbelow with reference to the sequence listing part.

[28225] GAM2025 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2025 target RNA, herein designated GAM TARGET RNA. GAM2025 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[28226] GAM2025 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2025 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2025 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2025 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2025 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[28227] The complementary binding of GAM2025 RNA, herein designated GAM RNA, to target binding sites on GAM2025 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2025 target RNA, herein designated GAM TARGET RNA, into GAM2025 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[28228] It is appreciated that GAM2025 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2025 target genes. The mRNA of each one of this plurality of GAM2025 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2025 RNA, herein designated GAM RNA, and which when bound by GAM2025 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2025 target proteins.

[28229] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2025 gene, herein designated GAM GENE, on one or more GAM2025 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding

sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[28230] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2025 correlate with, and may be deduced from, the identity of the target genes which GAM2025 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[28231] Nucleotide sequences of the GAM2025 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2025 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2025 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2025 are further described hereinbelow with reference to Table 1.

[28232] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2025 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[28233] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2026 (GAM2026) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[28234] GAM2026 is a novel bioinformatically detected regulatory, non protein

coding, micro RNA (miRNA) gene. The method by which GAM2026 was detected is described hereinabove with reference to Figs. 2-8.

[28235] GAM2026 gene, herein designated GAM GENE, and GAM2026 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[28236] GAM2026 gene, herein designated GAM GENE, encodes a GAM2026 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2026 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2026 precursor RNA is designated SEQ ID:2003, and is provided hereinbelow with reference to the sequence listing part.

[28237] GAM2026 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2026 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[28238] An enzyme complex designated DICER COMPLEX, dices the GAM2026 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2026 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin

structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 80%) nucleotide sequence of GAM2026 RNA is designated SEQ ID:4614, and is provided hereinbelow with reference to the sequence listing part.

[28239] GAM2026 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2026 target RNA, herein designated GAM TARGET RNA. GAM2026 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[28240] GAM2026 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2026 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2026 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2026 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2026 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target

binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[28241] The complementary binding of GAM2026 RNA, herein designated GAM RNA, to target binding sites on GAM2026 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2026 target RNA, herein designated GAM TARGET RNA, into GAM2026 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[28242] It is appreciated that GAM2026 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2026 target genes. The mRNA of each one of this plurality of GAM2026 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2026 RNA, herein designated GAM RNA, and which when bound by GAM2026 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2026 target proteins.

[28243] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2026 gene, herein designated GAM GENE, on one or more GAM2026 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary

binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[28244] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2026 correlate with, and may be deduced from, the identity of the target genes which GAM2026 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[28245] Nucleotide sequences of the GAM2026 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2026 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2026 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2026 are further described hereinbelow with reference to Table 1.

[28246] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2026 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[28247] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2027 (GAM2027) gene, which modulates

expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[28248] GAM2027 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2027 was detected is described hereinabove with reference to Figs. 2-8.

[28249] GAM2027 gene, herein designated GAM GENE, and GAM2027 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[28250] GAM2027 gene, herein designated GAM GENE, encodes a GAM2027 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2027 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2027 precursor RNA is designated SEQ ID:2004, and is provided hereinbelow with reference to the sequence listing part.

[28251] GAM2027 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2027 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[28252] An enzyme complex designated DICER COMPLEX, dices the GAM2027 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2027 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 79%) nucleotide sequence of GAM2027 RNA is designated SEQ ID:4615, and is provided hereinbelow with reference to the sequence listing part.

[28253] GAM2027 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2027 target RNA, herein designated GAM TARGET RNA. GAM2027 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[28254] GAM2027 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2027 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2027 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an

illustration only, and is not meant to be limiting GAM2027 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2027 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[28255] The complementary binding of GAM2027 RNA, herein designated GAM RNA, to target binding sites on GAM2027 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2027 target RNA, herein designated GAM TARGET RNA, into GAM2027 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[28256] It is appreciated that GAM2027 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2027 target genes. The mRNA of each one of this plurality of GAM2027 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2027 RNA, herein designated GAM RNA, and which when bound by GAM2027 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2027 target proteins.

[28257] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition

exerted by GAM2027 gene, herein designated GAM GENE, on one or more GAM2027 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[28258] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2027 correlate with, and may be deduced from, the identity of the target genes which GAM2027 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[28259] Nucleotide sequences of the GAM2027 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2027 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2027 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2027 are further described hereinbelow with reference to Table 1.

[28260] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2027 RNA, herein designated GAM RNA, are described hereinbelow

with reference to Table 2.

[28261] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2028 (GAM2028) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[28262] GAM2028 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2028 was detected is described hereinabove with reference to Figs. 2-8.

[28263] GAM2028 gene, herein designated GAM GENE, and GAM2028 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[28264] GAM2028 gene, herein designated GAM GENE, encodes a GAM2028 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2028 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2028 precursor RNA is designated SEQ ID:2005, and is provided hereinbelow with reference to the sequence listing part.

[28265] GAM2028 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2028 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA

encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[28266] An enzyme complex designated DICER COMPLEX, dices the GAM2028 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2028 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 86%) nucleotide sequence of GAM2028 RNA is designated SEQ ID:4616, and is provided hereinbelow with reference to the sequence listing part.

[28267] GAM2028 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2028 target RNA, herein designated GAM TARGET RNA. GAM2028 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[28268] GAM2028 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2028 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2028 RNA,

herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2028 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2028 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[28269] The complementary binding of GAM2028 RNA, herein designated GAM RNA, to target binding sites on GAM2028 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2028 target RNA, herein designated GAM TARGET RNA, into GAM2028 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[28270] It is appreciated that GAM2028 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2028 target genes. The mRNA of each one of this plurality of GAM2028 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2028 RNA, herein designated GAM RNA, and which when bound by GAM2028 RNA, herein designated GAM RNA,

causes inhibition of translation of respective one or more GAM2028 target proteins.

[28271] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2028 gene, herein designated GAM GENE, on one or more GAM2028 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[28272] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2028 correlate with, and may be deduced from, the identity of the target genes which GAM2028 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[28273] Nucleotide sequences of the GAM2028 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2028 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2028 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2028 are further described hereinbelow with reference to Table 1.

[28274] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2028 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[28275] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2029 (GAM2029) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[28276] GAM2029 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2029 was detected is described hereinabove with reference to Figs. 2-8.

[28277] GAM2029 gene, herein designated GAM GENE, and GAM2029 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[28278] GAM2029 gene, herein designated GAM GENE, encodes a GAM2029 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2029 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2029 precursor RNA is designated SEQ ID:2006, and is provided hereinbelow with reference to the sequence listing part.

[28279] GAM2029 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2029 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[28280] An enzyme complex designated DICER COMPLEX, dices the GAM2029 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2029 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 81%) nucleotide sequence of GAM2029 RNA is designated SEQ ID:4617, and is provided hereinbelow with reference to the sequence listing part.

[28281] GAM2029 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2029 target RNA, herein designated GAM TARGET RNA. GAM2029 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[28282] GAM2029 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2029 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2029 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2029 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2029 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[28283] The complementary binding of GAM2029 RNA, herein designated GAM RNA, to target binding sites on GAM2029 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2029 target RNA, herein designated GAM TARGET RNA, into GAM2029 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[28284] It is appreciated that GAM2029 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2029 target genes. The

mRNA of each one of this plurality of GAM2029 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2029 RNA, herein designated GAM RNA, and which when bound by GAM2029 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2029 target proteins.

[28285] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2029 gene, herein designated GAM GENE, on one or more GAM2029 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[28286] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2029 correlate with, and may be deduced from, the identity of the target genes which GAM2029 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[28287] Nucleotide sequences of the GAM2029 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2029 RNA, herein

designated GAM RNA, and a schematic representation of the secondary folding of GAM2029 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2029 are further described hereinbelow with reference to Table 1.

[28288] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2029 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[28289] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2030 (GAM2030) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[28290] GAM2030 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2030 was detected is described hereinabove with reference to Figs. 2-8.

[28291] GAM2030 gene, herein designated GAM GENE, and GAM2030 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[28292] GAM2030 gene, herein designated GAM GENE, encodes a GAM2030 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2030 precursor RNA,

herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2030 precursor RNA is designated SEQ ID:2007, and is provided hereinbelow with reference to the sequence listing part.

[28293] GAM2030 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2030 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[28294] An enzyme complex designated DICER COMPLEX, dices the GAM2030 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2030 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 85%) nucleotide sequence of GAM2030 RNA is designated SEQ ID:4618, and is provided hereinbelow with reference to the sequence listing part.

[28295] GAM2030 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2030 target RNA, herein designated GAM TARGET RNA. GAM2030 target RNA, herein designated GAM

TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[28296] GAM2030 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2030 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2030 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2030 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2030 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[28297] The complementary binding of GAM2030 RNA, herein designated GAM RNA, to target binding sites on GAM2030 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2030 target RNA, herein designated GAM TARGET RNA, into GAM2030 target protein, herein

designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[28298] It is appreciated that GAM2030 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2030 target genes. The mRNA of each one of this plurality of GAM2030 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2030 RNA, herein designated GAM RNA, and which when bound by GAM2030 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2030 target proteins.

[28299] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2030 gene, herein designated GAM GENE, on one or more GAM2030 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[28300] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2030 correlate with, and may be deduced from, the identity of the target

genes which GAM2030 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[28301] Nucleotide sequences of the GAM2030 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2030 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2030 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2030 are further described hereinbelow with reference to Table 1.

[28302] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2030 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[28303] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2031 (GAM2031) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[28304] GAM2031 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2031 was detected is described hereinabove with reference to Figs. 2-8.

[28305] GAM2031 gene, herein designated GAM GENE, and GAM2031 target gene, herein designated GAM TARGET GENE, are human genes contained in the

human genome.

[28306] GAM2031 gene, herein designated GAM GENE, encodes a GAM2031 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2031 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2031 precursor RNA is designated SEQ ID:2008, and is provided hereinbelow with reference to the sequence listing part.

[28307] GAM2031 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2031 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[28308] An enzyme complex designated DICER COMPLEX, dices the GAM2031 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2031 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM2031 RNA is designated SEQ ID:4619, and is provided

hereinbelow with reference to the sequence listing part.

[28309] GAM2031 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2031 target RNA, herein designated GAM TARGET RNA. GAM2031 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[28310] GAM2031 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2031 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2031 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2031 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2031 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[28311] The complementary binding of GAM2031 RNA, herein designated GAM RNA, to target binding sites on GAM2031 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2031 target RNA, herein designated GAM TARGET RNA, into GAM2031 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[28312] It is appreciated that GAM2031 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2031 target genes. The mRNA of each one of this plurality of GAM2031 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2031 RNA, herein designated GAM RNA, and which when bound by GAM2031 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2031 target proteins.

[28313] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2031 gene, herein designated GAM GENE, on one or more GAM2031 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding

sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[28314] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2031 correlate with, and may be deduced from, the identity of the target genes which GAM2031 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[28315] Nucleotide sequences of the GAM2031 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2031 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2031 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2031 are further described hereinbelow with reference to Table 1.

[28316] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2031 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[28317] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2032 (GAM2032) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[28318] GAM2032 is a novel bioinformatically detected regulatory, non protein

coding, micro RNA (miRNA) gene. The method by which GAM2032 was detected is described hereinabove with reference to Figs. 2-8.

[28319] GAM2032 gene, herein designated GAM GENE, and GAM2032 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[28320] GAM2032 gene, herein designated GAM GENE, encodes a GAM2032 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2032 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2032 precursor RNA is designated SEQ ID:2009, and is provided hereinbelow with reference to the sequence listing part.

[28321] GAM2032 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2032 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[28322] An enzyme complex designated DICER COMPLEX, dices the GAM2032 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2032 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin

structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 82%) nucleotide sequence of GAM2032 RNA is designated SEQ ID:4620, and is provided hereinbelow with reference to the sequence listing part.

[28323] GAM2032 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2032 target RNA, herein designated GAM TARGET RNA. GAM2032 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[28324] GAM2032 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2032 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2032 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2032 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2032 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target

binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[28325] The complementary binding of GAM2032 RNA, herein designated GAM RNA, to target binding sites on GAM2032 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2032 target RNA, herein designated GAM TARGET RNA, into GAM2032 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[28326] It is appreciated that GAM2032 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2032 target genes. The mRNA of each one of this plurality of GAM2032 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2032 RNA, herein designated GAM RNA, and which when bound by GAM2032 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2032 target proteins.

[28327] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2032 gene, herein designated GAM GENE, on one or more GAM2032 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary

binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[28328] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2032 correlate with, and may be deduced from, the identity of the target genes which GAM2032 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[28329] Nucleotide sequences of the GAM2032 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2032 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2032 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2032 are further described hereinbelow with reference to Table 1.

[28330] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2032 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[28331] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2033 (GAM2033) gene, which modulates

expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[28332] GAM2033 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2033 was detected is described hereinabove with reference to Figs. 2-8.

[28333] GAM2033 gene, herein designated GAM GENE, and GAM2033 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[28334] GAM2033 gene, herein designated GAM GENE, encodes a GAM2033 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2033 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2033 precursor RNA is designated SEQ ID:2010, and is provided hereinbelow with reference to the sequence listing part.

[28335] GAM2033 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2033 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[28336] An enzyme complex designated DICER COMPLEX, dices the GAM2033 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2033 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 82%) nucleotide sequence of GAM2033 RNA is designated SEQ ID:4621, and is provided hereinbelow with reference to the sequence listing part.

[28337] GAM2033 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2033 target RNA, herein designated GAM TARGET RNA. GAM2033 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[28338] GAM2033 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2033 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2033 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an

illustration only, and is not meant to be limiting GAM2033 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2033 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[28339] The complementary binding of GAM2033 RNA, herein designated GAM RNA, to target binding sites on GAM2033 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2033 target RNA, herein designated GAM TARGET RNA, into GAM2033 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[28340] It is appreciated that GAM2033 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2033 target genes. The mRNA of each one of this plurality of GAM2033 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2033 RNA, herein designated GAM RNA, and which when bound by GAM2033 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2033 target proteins.

[28341] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition

exerted by GAM2033 gene, herein designated GAM GENE, on one or more GAM2033 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[28342] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2033 correlate with, and may be deduced from, the identity of the target genes which GAM2033 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[28343] Nucleotide sequences of the GAM2033 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2033 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2033 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2033 are further described hereinbelow with reference to Table 1.

[28344] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2033 RNA, herein designated GAM RNA, are described hereinbelow

with reference to Table 2.

[28345] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2034 (GAM2034) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[28346] GAM2034 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2034 was detected is described hereinabove with reference to Figs. 2-8.

[28347] GAM2034 gene, herein designated GAM GENE, and GAM2034 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[28348] GAM2034 gene, herein designated GAM GENE, encodes a GAM2034 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2034 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2034 precursor RNA is designated SEQ ID:2011, and is provided hereinbelow with reference to the sequence listing part.

[28349] GAM2034 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2034 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA

encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[28350] An enzyme complex designated DICER COMPLEX, dices the GAM2034 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2034 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 87%) nucleotide sequence of GAM2034 RNA is designated SEQ ID:4622, and is provided hereinbelow with reference to the sequence listing part.

[28351] GAM2034 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2034 target RNA, herein designated GAM TARGET RNA. GAM2034 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[28352] GAM2034 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2034 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2034 RNA,

herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2034 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2034 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[28353] The complementary binding of GAM2034 RNA, herein designated GAM RNA, to target binding sites on GAM2034 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2034 target RNA, herein designated GAM TARGET RNA, into GAM2034 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[28354] It is appreciated that GAM2034 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2034 target genes. The mRNA of each one of this plurality of GAM2034 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2034 RNA, herein designated GAM RNA, and which when bound by GAM2034 RNA, herein designated GAM RNA,

causes inhibition of translation of respective one or more GAM2034 target proteins.

[28355] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2034 gene, herein designated GAM GENE, on one or more GAM2034 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[28356] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2034 correlate with, and may be deduced from, the identity of the target genes which GAM2034 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[28357] Nucleotide sequences of the GAM2034 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2034 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2034 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2034 are further described hereinbelow with reference to Table 1.

[28358] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2034 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[28359] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2035 (GAM2035) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[28360] GAM2035 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2035 was detected is described hereinabove with reference to Figs. 2-8.

[28361] GAM2035 gene, herein designated GAM GENE, and GAM2035 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[28362] GAM2035 gene, herein designated GAM GENE, encodes a GAM2035 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2035 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2035 precursor RNA is designated SEQ ID:2012, and is provided hereinbelow with reference to the sequence listing part.

[28363] GAM2035 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2035 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[28364] An enzyme complex designated DICER COMPLEX, dices the GAM2035 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2035 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 82%) nucleotide sequence of GAM2035 RNA is designated SEQ ID:4623, and is provided hereinbelow with reference to the sequence listing part.

[28365] GAM2035 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2035 target RNA, herein designated GAM TARGET RNA. GAM2035 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[28366] GAM2035 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2035 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2035 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2035 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2035 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[28367] The complementary binding of GAM2035 RNA, herein designated GAM RNA, to target binding sites on GAM2035 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2035 target RNA, herein designated GAM TARGET RNA, into GAM2035 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[28368] It is appreciated that GAM2035 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2035 target genes. The

mRNA of each one of this plurality of GAM2035 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2035 RNA, herein designated GAM RNA, and which when bound by GAM2035 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2035 target proteins.

[28369] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2035 gene, herein designated GAM GENE, on one or more GAM2035 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[28370] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2035 correlate with, and may be deduced from, the identity of the target genes which GAM2035 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[28371] Nucleotide sequences of the GAM2035 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2035 RNA, herein

designated GAM RNA, and a schematic representation of the secondary folding of GAM2035 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2035 are further described hereinbelow with reference to Table 1.

[28372] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2035 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[28373] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2036 (GAM2036) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[28374] GAM2036 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2036 was detected is described hereinabove with reference to Figs. 2-8.

[28375] GAM2036 gene, herein designated GAM GENE, and GAM2036 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[28376] GAM2036 gene, herein designated GAM GENE, encodes a GAM2036 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2036 precursor RNA,

herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2036 precursor RNA is designated SEQ ID:2013, and is provided hereinbelow with reference to the sequence listing part.

[28377] GAM2036 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2036 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[28378] An enzyme complex designated DICER COMPLEX, dices the GAM2036 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2036 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 91%) nucleotide sequence of GAM2036 RNA is designated SEQ ID:4624, and is provided hereinbelow with reference to the sequence listing part.

[28379] GAM2036 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2036 target RNA, herein designated GAM TARGET RNA. GAM2036 target RNA, herein designated GAM

TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[28380] GAM2036 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2036 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2036 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2036 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2036 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[28381] The complementary binding of GAM2036 RNA, herein designated GAM RNA, to target binding sites on GAM2036 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2036 target RNA, herein designated GAM TARGET RNA, into GAM2036 target protein, herein

designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[28382] It is appreciated that GAM2036 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2036 target genes. The mRNA of each one of this plurality of GAM2036 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2036 RNA, herein designated GAM RNA, and which when bound by GAM2036 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2036 target proteins.

[28383] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2036 gene, herein designated GAM GENE, on one or more GAM2036 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[28384] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2036 correlate with, and may be deduced from, the identity of the target

genes which GAM2036 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[28385] Nucleotide sequences of the GAM2036 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2036 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2036 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2036 are further described hereinbelow with reference to Table 1.

[28386] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2036 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[28387] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2037 (GAM2037) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[28388] GAM2037 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2037 was detected is described hereinabove with reference to Figs. 2-8.

[28389] GAM2037 gene, herein designated GAM GENE, and GAM2037 target gene, herein designated GAM TARGET GENE, are human genes contained in the

human genome.

[28390] GAM2037 gene, herein designated GAM GENE, encodes a GAM2037 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2037 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2037 precursor RNA is designated SEQ ID:2014, and is provided hereinbelow with reference to the sequence listing part.

[28391] GAM2037 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2037 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[28392] An enzyme complex designated DICER COMPLEX, dices the GAM2037 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2037 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 89%) nucleotide sequence of GAM2037 RNA is designated SEQ ID:4625, and is provided

hereinbelow with reference to the sequence listing part.

[28393] GAM2037 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2037 target RNA, herein designated GAM TARGET RNA. GAM2037 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[28394] GAM2037 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2037 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2037 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2037 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2037 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[28395] The complementary binding of GAM2037 RNA, herein designated GAM RNA, to target binding sites on GAM2037 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2037 target RNA, herein designated GAM TARGET RNA, into GAM2037 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[28396] It is appreciated that GAM2037 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2037 target genes. The mRNA of each one of this plurality of GAM2037 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2037 RNA, herein designated GAM RNA, and which when bound by GAM2037 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2037 target proteins.

[28397] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2037 gene, herein designated GAM GENE, on one or more GAM2037 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding

sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[28398] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2037 correlate with, and may be deduced from, the identity of the target genes which GAM2037 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[28399] Nucleotide sequences of the GAM2037 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2037 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2037 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2037 are further described hereinbelow with reference to Table 1.

[28400] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2037 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[28401] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2038 (GAM2038) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[28402] GAM2038 is a novel bioinformatically detected regulatory, non protein

coding, micro RNA (miRNA) gene. The method by which GAM2038 was detected is described hereinabove with reference to Figs. 2-8.

[28403] GAM2038 gene, herein designated GAM GENE, and GAM2038 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[28404] GAM2038 gene, herein designated GAM GENE, encodes a GAM2038 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2038 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2038 precursor RNA is designated SEQ ID:2015, and is provided hereinbelow with reference to the sequence listing part.

[28405] GAM2038 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2038 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[28406] An enzyme complex designated DICER COMPLEX, dices the GAM2038 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2038 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin

structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 93%) nucleotide sequence of GAM2038 RNA is designated SEQ ID:4626, and is provided hereinbelow with reference to the sequence listing part.

[28407] GAM2038 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2038 target RNA, herein designated GAM TARGET RNA. GAM2038 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[28408] GAM2038 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2038 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2038 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2038 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2038 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target

binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[28409] The complementary binding of GAM2038 RNA, herein designated GAM RNA, to target binding sites on GAM2038 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2038 target RNA, herein designated GAM TARGET RNA, into GAM2038 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[28410] It is appreciated that GAM2038 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2038 target genes. The mRNA of each one of this plurality of GAM2038 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2038 RNA, herein designated GAM RNA, and which when bound by GAM2038 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2038 target proteins.

[28411] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2038 gene, herein designated GAM GENE, on one or more GAM2038 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary

binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[28412] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2038 correlate with, and may be deduced from, the identity of the target genes which GAM2038 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[28413] Nucleotide sequences of the GAM2038 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2038 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2038 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2038 are further described hereinbelow with reference to Table 1.

[28414] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2038 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[28415] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2039 (GAM2039) gene, which modulates

expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[28416] GAM2039 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2039 was detected is described hereinabove with reference to Figs. 2-8.

[28417] GAM2039 gene, herein designated GAM GENE, and GAM2039 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[28418] GAM2039 gene, herein designated GAM GENE, encodes a GAM2039 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2039 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2039 precursor RNA is designated SEQ ID:2016, and is provided hereinbelow with reference to the sequence listing part.

[28419] GAM2039 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2039 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[28420] An enzyme complex designated DICER COMPLEX, dices the GAM2039 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2039 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 87%) nucleotide sequence of GAM2039 RNA is designated SEQ ID:4627, and is provided hereinbelow with reference to the sequence listing part.

[28421] GAM2039 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2039 target RNA, herein designated GAM TARGET RNA. GAM2039 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[28422] GAM2039 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2039 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2039 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an

illustration only, and is not meant to be limiting GAM2039 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2039 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[28423] The complementary binding of GAM2039 RNA, herein designated GAM RNA, to target binding sites on GAM2039 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2039 target RNA, herein designated GAM TARGET RNA, into GAM2039 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[28424] It is appreciated that GAM2039 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2039 target genes. The mRNA of each one of this plurality of GAM2039 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2039 RNA, herein designated GAM RNA, and which when bound by GAM2039 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2039 target proteins.

[28425] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition

exerted by GAM2039 gene, herein designated GAM GENE, on one or more GAM2039 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[28426] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2039 correlate with, and may be deduced from, the identity of the target genes which GAM2039 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[28427] Nucleotide sequences of the GAM2039 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2039 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2039 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2039 are further described hereinbelow with reference to Table 1.

[28428] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2039 RNA, herein designated GAM RNA, are described hereinbelow

with reference to Table 2.

[28429] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2040 (GAM2040) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[28430] GAM2040 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2040 was detected is described hereinabove with reference to Figs. 2-8.

[28431] GAM2040 gene, herein designated GAM GENE, and GAM2040 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[28432] GAM2040 gene, herein designated GAM GENE, encodes a GAM2040 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2040 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2040 precursor RNA is designated SEQ ID:2017, and is provided hereinbelow with reference to the sequence listing part.

[28433] GAM2040 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2040 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA

encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[28434] An enzyme complex designated DICER COMPLEX, dices the GAM2040 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2040 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 83%) nucleotide sequence of GAM2040 RNA is designated SEQ ID:4628, and is provided hereinbelow with reference to the sequence listing part.

[28435] GAM2040 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2040 target RNA, herein designated GAM TARGET RNA. GAM2040 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[28436] GAM2040 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2040 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2040 RNA,

herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2040 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2040 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[28437] The complementary binding of GAM2040 RNA, herein designated GAM RNA, to target binding sites on GAM2040 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2040 target RNA, herein designated GAM TARGET RNA, into GAM2040 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[28438] It is appreciated that GAM2040 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2040 target genes. The mRNA of each one of this plurality of GAM2040 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2040 RNA, herein designated GAM RNA, and which when bound by GAM2040 RNA, herein designated GAM RNA,

causes inhibition of translation of respective one or more GAM2040 target proteins.

[28439] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2040 gene, herein designated GAM GENE, on one or more GAM2040 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[28440] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2040 correlate with, and may be deduced from, the identity of the target genes which GAM2040 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[28441] Nucleotide sequences of the GAM2040 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2040 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2040 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2040 are further described hereinbelow with reference to Table 1.

[28442] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2040 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[28443] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2041 (GAM2041) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[28444] GAM2041 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2041 was detected is described hereinabove with reference to Figs. 2-8.

[28445] GAM2041 gene, herein designated GAM GENE, and GAM2041 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[28446] GAM2041 gene, herein designated GAM GENE, encodes a GAM2041 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2041 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2041 precursor RNA is designated SEQ ID:2018, and is provided hereinbelow with reference to the sequence listing part.

[28447] GAM2041 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2041 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[28448] An enzyme complex designated DICER COMPLEX, dices the GAM2041 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2041 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 81%) nucleotide sequence of GAM2041 RNA is designated SEQ ID:4629, and is provided hereinbelow with reference to the sequence listing part.

[28449] GAM2041 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2041 target RNA, herein designated GAM TARGET RNA. GAM2041 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[28450] GAM2041 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2041 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2041 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2041 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2041 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[28451] The complementary binding of GAM2041 RNA, herein designated GAM RNA, to target binding sites on GAM2041 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2041 target RNA, herein designated GAM TARGET RNA, into GAM2041 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[28452] It is appreciated that GAM2041 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2041 target genes. The

mRNA of each one of this plurality of GAM2041 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2041 RNA, herein designated GAM RNA, and which when bound by GAM2041 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2041 target proteins.

[28453] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2041 gene, herein designated GAM GENE, on one or more GAM2041 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[28454] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2041 correlate with, and may be deduced from, the identity of the target genes which GAM2041 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[28455] Nucleotide sequences of the GAM2041 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2041 RNA, herein

designated GAM RNA, and a schematic representation of the secondary folding of GAM2041 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2041 are further described hereinbelow with reference to Table 1.

[28456] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2041 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[28457] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2042 (GAM2042) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[28458] GAM2042 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2042 was detected is described hereinabove with reference to Figs. 2-8.

[28459] GAM2042 gene, herein designated GAM GENE, and GAM2042 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[28460] GAM2042 gene, herein designated GAM GENE, encodes a GAM2042 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2042 precursor RNA,

herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2042 precursor RNA is designated SEQ ID:2019, and is provided hereinbelow with reference to the sequence listing part.

[28461] GAM2042 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2042 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[28462] An enzyme complex designated DICER COMPLEX, dices the GAM2042 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2042 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM2042 RNA is designated SEQ ID:4631, and is provided hereinbelow with reference to the sequence listing part.

[28463] GAM2042 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2042 target RNA, herein designated GAM TARGET RNA. GAM2042 target RNA, herein designated GAM

TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[28464] GAM2042 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2042 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2042 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2042 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2042 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[28465] The complementary binding of GAM2042 RNA, herein designated GAM RNA, to target binding sites on GAM2042 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2042 target RNA, herein designated GAM TARGET RNA, into GAM2042 target protein, herein

designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[28466] It is appreciated that GAM2042 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2042 target genes. The mRNA of each one of this plurality of GAM2042 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2042 RNA, herein designated GAM RNA, and which when bound by GAM2042 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2042 target proteins.

[28467] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2042 gene, herein designated GAM GENE, on one or more GAM2042 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[28468] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2042 correlate with, and may be deduced from, the identity of the target

genes which GAM2042 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[28469] Nucleotide sequences of the GAM2042 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2042 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2042 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2042 are further described hereinbelow with reference to Table 1.

[28470] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2042 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[28471] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2043 (GAM2043) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[28472] GAM2043 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2043 was detected is described hereinabove with reference to Figs. 2-8.

[28473] GAM2043 gene, herein designated GAM GENE, and GAM2043 target gene, herein designated GAM TARGET GENE, are human genes contained in the

human genome.

[28474] GAM2043 gene, herein designated GAM GENE, encodes a GAM2043 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2043 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2043 precursor RNA is designated SEQ ID:2020, and is provided hereinbelow with reference to the sequence listing part.

[28475] GAM2043 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2043 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[28476] An enzyme complex designated DICER COMPLEX, dices the GAM2043 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2043 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM2043 RNA is designated SEQ ID:4630, and is provided

hereinbelow with reference to the sequence listing part.

[28477] GAM2043 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2043 target RNA, herein designated GAM TARGET RNA. GAM2043 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[28478] GAM2043 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2043 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2043 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2043 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2043 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[28479] The complementary binding of GAM2043 RNA, herein designated GAM RNA, to target binding sites on GAM2043 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2043 target RNA, herein designated GAM TARGET RNA, into GAM2043 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[28480] It is appreciated that GAM2043 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2043 target genes. The mRNA of each one of this plurality of GAM2043 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2043 RNA, herein designated GAM RNA, and which when bound by GAM2043 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2043 target proteins.

[28481] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2043 gene, herein designated GAM GENE, on one or more GAM2043 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding

sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[28482] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2043 correlate with, and may be deduced from, the identity of the target genes which GAM2043 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[28483] Nucleotide sequences of the GAM2043 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2043 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2043 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2043 are further described hereinbelow with reference to Table 1.

[28484] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2043 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[28485] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2044 (GAM2044) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[28486] GAM2044 is a novel bioinformatically detected regulatory, non protein

coding, micro RNA (miRNA) gene. The method by which GAM2044 was detected is described hereinabove with reference to Figs. 2-8.

[28487] GAM2044 gene, herein designated GAM GENE, and GAM2044 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[28488] GAM2044 gene, herein designated GAM GENE, encodes a GAM2044 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2044 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2044 precursor RNA is designated SEQ ID:2021, and is provided hereinbelow with reference to the sequence listing part.

[28489] GAM2044 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2044 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[28490] An enzyme complex designated DICER COMPLEX, dices the GAM2044 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2044 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin

structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 87%) nucleotide sequence of GAM2044 RNA is designated SEQ ID:4632, and is provided hereinbelow with reference to the sequence listing part.

[28491] GAM2044 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2044 target RNA, herein designated GAM TARGET RNA. GAM2044 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[28492] GAM2044 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2044 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2044 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2044 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2044 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target

binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[28493] The complementary binding of GAM2044 RNA, herein designated GAM RNA, to target binding sites on GAM2044 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2044 target RNA, herein designated GAM TARGET RNA, into GAM2044 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[28494] It is appreciated that GAM2044 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2044 target genes. The mRNA of each one of this plurality of GAM2044 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2044 RNA, herein designated GAM RNA, and which when bound by GAM2044 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2044 target proteins.

[28495] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2044 gene, herein designated GAM GENE, on one or more GAM2044 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary

binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[28496] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2044 correlate with, and may be deduced from, the identity of the target genes which GAM2044 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[28497] Nucleotide sequences of the GAM2044 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2044 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2044 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2044 are further described hereinbelow with reference to Table 1.

[28498] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2044 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[28499] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2045 (GAM2045) gene, which modulates

expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[28500] GAM2045 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2045 was detected is described hereinabove with reference to Figs. 2-8.

[28501] GAM2045 gene, herein designated GAM GENE, and GAM2045 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[28502] GAM2045 gene, herein designated GAM GENE, encodes a GAM2045 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2045 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2045 precursor RNA is designated SEQ ID:2022, and is provided hereinbelow with reference to the sequence listing part.

[28503] GAM2045 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2045 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[28504] An enzyme complex designated DICER COMPLEX, dices the GAM2045 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2045 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 83%) nucleotide sequence of GAM2045 RNA is designated SEQ ID:4633, and is provided hereinbelow with reference to the sequence listing part.

[28505] GAM2045 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2045 target RNA, herein designated GAM TARGET RNA. GAM2045 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[28506] GAM2045 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2045 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2045 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an

illustration only, and is not meant to be limiting GAM2045 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2045 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[28507] The complementary binding of GAM2045 RNA, herein designated GAM RNA, to target binding sites on GAM2045 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2045 target RNA, herein designated GAM TARGET RNA, into GAM2045 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[28508] It is appreciated that GAM2045 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2045 target genes. The mRNA of each one of this plurality of GAM2045 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2045 RNA, herein designated GAM RNA, and which when bound by GAM2045 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2045 target proteins.

[28509] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition

exerted by GAM2045 gene, herein designated GAM GENE, on one or more GAM2045 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[28510] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2045 correlate with, and may be deduced from, the identity of the target genes which GAM2045 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[28511] Nucleotide sequences of the GAM2045 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2045 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2045 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2045 are further described hereinbelow with reference to Table 1.

[28512] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2045 RNA, herein designated GAM RNA, are described hereinbelow

with reference to Table 2.

[28513] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2046 (GAM2046) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[28514] GAM2046 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2046 was detected is described hereinabove with reference to Figs. 2-8.

[28515] GAM2046 gene, herein designated GAM GENE, and GAM2046 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[28516] GAM2046 gene, herein designated GAM GENE, encodes a GAM2046 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2046 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2046 precursor RNA is designated SEQ ID:2023, and is provided hereinbelow with reference to the sequence listing part.

[28517] GAM2046 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2046 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA

encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[28518] An enzyme complex designated DICER COMPLEX, dices the GAM2046 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2046 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 83%) nucleotide sequence of GAM2046 RNA is designated SEQ ID:4634, and is provided hereinbelow with reference to the sequence listing part.

[28519] GAM2046 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2046 target RNA, herein designated GAM TARGET RNA. GAM2046 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[28520] GAM2046 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2046 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2046 RNA,

herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2046 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2046 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[28521] The complementary binding of GAM2046 RNA, herein designated GAM RNA, to target binding sites on GAM2046 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2046 target RNA, herein designated GAM TARGET RNA, into GAM2046 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[28522] It is appreciated that GAM2046 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2046 target genes. The mRNA of each one of this plurality of GAM2046 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2046 RNA, herein designated GAM RNA, and which when bound by GAM2046 RNA, herein designated GAM RNA,

causes inhibition of translation of respective one or more GAM2046 target proteins.

[28523] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2046 gene, herein designated GAM GENE, on one or more GAM2046 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[28524] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2046 correlate with, and may be deduced from, the identity of the target genes which GAM2046 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[28525] Nucleotide sequences of the GAM2046 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2046 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2046 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2046 are further described hereinbelow with reference to Table 1.

[28526] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2046 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[28527] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2047 (GAM2047) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[28528] GAM2047 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2047 was detected is described hereinabove with reference to Figs. 2-8.

[28529] GAM2047 gene, herein designated GAM GENE, and GAM2047 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[28530] GAM2047 gene, herein designated GAM GENE, encodes a GAM2047 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2047 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2047 precursor RNA is designated SEQ ID:2024, and is provided hereinbelow with reference to the sequence listing part.

[28531] GAM2047 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2047 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[28532] An enzyme complex designated DICER COMPLEX, dices the GAM2047 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2047 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 81%) nucleotide sequence of GAM2047 RNA is designated SEQ ID:4636, and is provided hereinbelow with reference to the sequence listing part.

[28533] GAM2047 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2047 target RNA, herein designated GAM TARGET RNA. GAM2047 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[28534] GAM2047 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2047 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2047 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2047 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2047 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[28535] The complementary binding of GAM2047 RNA, herein designated GAM RNA, to target binding sites on GAM2047 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2047 target RNA, herein designated GAM TARGET RNA, into GAM2047 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[28536] It is appreciated that GAM2047 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2047 target genes. The

mRNA of each one of this plurality of GAM2047 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2047 RNA, herein designated GAM RNA, and which when bound by GAM2047 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2047 target proteins.

[28537] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2047 gene, herein designated GAM GENE, on one or more GAM2047 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[28538] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2047 correlate with, and may be deduced from, the identity of the target genes which GAM2047 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[28539] Nucleotide sequences of the GAM2047 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2047 RNA, herein

designated GAM RNA, and a schematic representation of the secondary folding of GAM2047 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2047 are further described hereinbelow with reference to Table 1.

[28540] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2047 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[28541] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2048 (GAM2048) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[28542] GAM2048 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2048 was detected is described hereinabove with reference to Figs. 2-8.

[28543] GAM2048 gene, herein designated GAM GENE, and GAM2048 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[28544] GAM2048 gene, herein designated GAM GENE, encodes a GAM2048 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2048 precursor RNA,

herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2048 precursor RNA is designated SEQ ID:2025, and is provided hereinbelow with reference to the sequence listing part.

[28545] GAM2048 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2048 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[28546] An enzyme complex designated DICER COMPLEX, dices the GAM2048 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2048 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 90%) nucleotide sequence of GAM2048 RNA is designated SEQ ID:4635, and is provided hereinbelow with reference to the sequence listing part.

[28547] GAM2048 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2048 target RNA, herein designated GAM TARGET RNA. GAM2048 target RNA, herein designated GAM

TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[28548] GAM2048 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2048 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2048 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2048 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2048 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[28549] The complementary binding of GAM2048 RNA, herein designated GAM RNA, to target binding sites on GAM2048 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2048 target RNA, herein designated GAM TARGET RNA, into GAM2048 target protein, herein

designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[28550] It is appreciated that GAM2048 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2048 target genes. The mRNA of each one of this plurality of GAM2048 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2048 RNA, herein designated GAM RNA, and which when bound by GAM2048 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2048 target proteins.

[28551] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2048 gene, herein designated GAM GENE, on one or more GAM2048 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[28552] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2048 correlate with, and may be deduced from, the identity of the target

genes which GAM2048 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[28553] Nucleotide sequences of the GAM2048 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2048 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2048 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2048 are further described hereinbelow with reference to Table 1.

[28554] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2048 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[28555] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2049 (GAM2049) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[28556] GAM2049 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2049 was detected is described hereinabove with reference to Figs. 2-8.

[28557] GAM2049 gene, herein designated GAM GENE, and GAM2049 target gene, herein designated GAM TARGET GENE, are human genes contained in the

human genome.

[28558] GAM2049 gene, herein designated GAM GENE, encodes a GAM2049 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2049 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2049 precursor RNA is designated SEQ ID:2026, and is provided hereinbelow with reference to the sequence listing part.

[28559] GAM2049 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2049 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[28560] An enzyme complex designated DICER COMPLEX, dices the GAM2049 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2049 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM2049 RNA is designated SEQ ID:4637, and is provided hereinbelow with reference to the sequence listing part.

[28561] GAM2049 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2049 target RNA, herein designated GAM TARGET RNA. GAM2049 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[28562] GAM2049 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2049 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2049 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2049 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2049 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[28563] The complementary binding of GAM2049 RNA, herein designated GAM RNA, to target binding sites on GAM2049 target RNA, herein designated

GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2049 target RNA, herein designated GAM TARGET RNA, into GAM2049 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[28564] It is appreciated that GAM2049 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2049 target genes. The mRNA of each one of this plurality of GAM2049 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2049 RNA, herein designated GAM RNA, and which when bound by GAM2049 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2049 target proteins.

[28565] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2049 gene, herein designated GAM GENE, on one or more GAM2049 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[28566] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2049 correlate with, and may be deduced from, the identity of the target genes which GAM2049 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[28567] Nucleotide sequences of the GAM2049 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2049 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2049 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2049 are further described hereinbelow with reference to Table 1.

[28568] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2049 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[28569] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2050 (GAM2050) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[28570] GAM2050 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2050 was detected is described hereinabove with reference to Figs. 2-8.

[28571] GAM2050 gene, herein designated GAM GENE, and GAM2050 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[28572] GAM2050 gene, herein designated GAM GENE, encodes a GAM2050 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2050 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2050 precursor RNA is designated SEQ ID:2027, and is provided hereinbelow with reference to the sequence listing part.

[28573] GAM2050 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2050 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[28574] An enzyme complex designated DICER COMPLEX, dices the GAM2050 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2050 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer

together with other necessary proteins. A probable (over 82%) nucleotide sequence of GAM2050 RNA is designated SEQ ID:4638, and is provided hereinbelow with reference to the sequence listing part.

[28575] GAM2050 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2050 target RNA, herein designated GAM TARGET RNA. GAM2050 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[28576] GAM2050 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2050 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2050 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2050 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2050 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or

in both 3UTR and 5UTR regions.

[28577] The complementary binding of GAM2050 RNA, herein designated GAM RNA, to target binding sites on GAM2050 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2050 target RNA, herein designated GAM TARGET RNA, into GAM2050 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[28578] It is appreciated that GAM2050 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2050 target genes. The mRNA of each one of this plurality of GAM2050 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2050 RNA, herein designated GAM RNA, and which when bound by GAM2050 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2050 target proteins.

[28579] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2050 gene, herein designated GAM GENE, on one or more GAM2050 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes

are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[28580] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2050 correlate with, and may be deduced from, the identity of the target genes which GAM2050 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[28581] Nucleotide sequences of the GAM2050 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2050 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2050 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2050 are further described hereinbelow with reference to Table 1.

[28582] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2050 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[28583] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2051 (GAM2051) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[28584] GAM2051 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2051 was detected is described hereinabove with reference to Figs. 2-8.

[28585] GAM2051 gene, herein designated GAM GENE, and GAM2051 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[28586] GAM2051 gene, herein designated GAM GENE, encodes a GAM2051 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2051 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2051 precursor RNA is designated SEQ ID:2028, and is provided hereinbelow with reference to the sequence listing part.

[28587] GAM2051 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2051 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[28588] An enzyme complex designated DICER COMPLEX, dices the GAM2051 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2051 RNA, herein designated GAM RNA, a single stranded

~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 85%) nucleotide sequence of GAM2051 RNA is designated SEQ ID:4639, and is provided hereinbelow with reference to the sequence listing part.

[28589] GAM2051 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2051 target RNA, herein designated GAM TARGET RNA. GAM2051 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[28590] GAM2051 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2051 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2051 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2051 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2051 target RNA, herein designated GAM

TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[28591] The complementary binding of GAM2051 RNA, herein designated GAM RNA, to target binding sites on GAM2051 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2051 target RNA, herein designated GAM TARGET RNA, into GAM2051 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[28592] It is appreciated that GAM2051 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2051 target genes. The mRNA of each one of this plurality of GAM2051 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2051 RNA, herein designated GAM RNA, and which when bound by GAM2051 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2051 target proteins.

[28593] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2051 gene, herein designated GAM GENE, on one or more GAM2051 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with

reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[28594] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2051 correlate with, and may be deduced from, the identity of the target genes which GAM2051 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[28595] Nucleotide sequences of the GAM2051 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2051 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2051 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2051 are further described hereinbelow with reference to Table 1.

[28596] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2051 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[28597] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as

Genomic Address Messenger 2052 (GAM2052) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[28598] GAM2052 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2052 was detected is described hereinabove with reference to Figs. 2-8.

[28599] GAM2052 gene, herein designated GAM GENE, and GAM2052 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[28600] GAM2052 gene, herein designated GAM GENE, encodes a GAM2052 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2052 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2052 precursor RNA is designated SEQ ID:2029, and is provided hereinbelow with reference to the sequence listing part.

[28601] GAM2052 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2052 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[28602] An enzyme complex designated DICER COMPLEX, dices the GAM2052 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2052 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 80%) nucleotide sequence of GAM2052 RNA is designated SEQ ID:4640, and is provided hereinbelow with reference to the sequence listing part.

[28603] GAM2052 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2052 target RNA, herein designated GAM TARGET RNA. GAM2052 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[28604] GAM2052 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2052 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2052 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an

illustration only, and is not meant to be limiting GAM2052 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2052 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[28605] The complementary binding of GAM2052 RNA, herein designated GAM RNA, to target binding sites on GAM2052 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2052 target RNA, herein designated GAM TARGET RNA, into GAM2052 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[28606] It is appreciated that GAM2052 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2052 target genes. The mRNA of each one of this plurality of GAM2052 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2052 RNA, herein designated GAM RNA, and which when bound by GAM2052 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2052 target proteins.

[28607] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition

exerted by GAM2052 gene, herein designated GAM GENE, on one or more GAM2052 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[28608] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2052 correlate with, and may be deduced from, the identity of the target genes which GAM2052 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[28609] Nucleotide sequences of the GAM2052 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2052 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2052 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2052 are further described hereinbelow with reference to Table 1.

[28610] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2052 RNA, herein designated GAM RNA, are described hereinbelow

with reference to Table 2.

[28611] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2053 (GAM2053) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[28612] GAM2053 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2053 was detected is described hereinabove with reference to Figs. 2-8.

[28613] GAM2053 gene, herein designated GAM GENE, and GAM2053 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[28614] GAM2053 gene, herein designated GAM GENE, encodes a GAM2053 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2053 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2053 precursor RNA is designated SEQ ID:2030, and is provided hereinbelow with reference to the sequence listing part.

[28615] GAM2053 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2053 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA

encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[28616] An enzyme complex designated DICER COMPLEX, dices the GAM2053 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2053 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 85%) nucleotide sequence of GAM2053 RNA is designated SEQ ID:4641, and is provided hereinbelow with reference to the sequence listing part.

[28617] GAM2053 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2053 target RNA, herein designated GAM TARGET RNA. GAM2053 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[28618] GAM2053 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2053 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2053 RNA,

herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2053 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2053 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[28619] The complementary binding of GAM2053 RNA, herein designated GAM RNA, to target binding sites on GAM2053 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2053 target RNA, herein designated GAM TARGET RNA, into GAM2053 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[28620] It is appreciated that GAM2053 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2053 target genes. The mRNA of each one of this plurality of GAM2053 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2053 RNA, herein designated GAM RNA, and which when bound by GAM2053 RNA, herein designated GAM RNA,

causes inhibition of translation of respective one or more GAM2053 target proteins.

[28621] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2053 gene, herein designated GAM GENE, on one or more GAM2053 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[28622] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2053 correlate with, and may be deduced from, the identity of the target genes which GAM2053 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[28623] Nucleotide sequences of the GAM2053 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2053 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2053 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2053 are further described hereinbelow with reference to Table 1.

[28624] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2053 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[28625] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2054 (GAM2054) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[28626] GAM2054 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2054 was detected is described hereinabove with reference to Figs. 2-8.

[28627] GAM2054 gene, herein designated GAM GENE, and GAM2054 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[28628] GAM2054 gene, herein designated GAM GENE, encodes a GAM2054 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2054 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2054 precursor RNA is designated SEQ ID:2031, and is provided hereinbelow with reference to the sequence listing part.

[28629] GAM2054 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2054 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[28630] An enzyme complex designated DICER COMPLEX, dices the GAM2054 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2054 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 85%) nucleotide sequence of GAM2054 RNA is designated SEQ ID:4643, and is provided hereinbelow with reference to the sequence listing part.

[28631] GAM2054 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2054 target RNA, herein designated GAM TARGET RNA. GAM2054 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[28632] GAM2054 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2054 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2054 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2054 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2054 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[28633] The complementary binding of GAM2054 RNA, herein designated GAM RNA, to target binding sites on GAM2054 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2054 target RNA, herein designated GAM TARGET RNA, into GAM2054 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[28634] It is appreciated that GAM2054 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2054 target genes. The

mRNA of each one of this plurality of GAM2054 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2054 RNA, herein designated GAM RNA, and which when bound by GAM2054 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2054 target proteins.

[28635] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2054 gene, herein designated GAM GENE, on one or more GAM2054 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[28636] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2054 correlate with, and may be deduced from, the identity of the target genes which GAM2054 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[28637] Nucleotide sequences of the GAM2054 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2054 RNA, herein

designated GAM RNA, and a schematic representation of the secondary folding of GAM2054 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2054 are further described hereinbelow with reference to Table 1.

[28638] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2054 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[28639] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2055 (GAM2055) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[28640] GAM2055 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2055 was detected is described hereinabove with reference to Figs. 2-8.

[28641] GAM2055 gene, herein designated GAM GENE, and GAM2055 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[28642] GAM2055 gene, herein designated GAM GENE, encodes a GAM2055 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2055 precursor RNA,

herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2055 precursor RNA is designated SEQ ID:2032, and is provided hereinbelow with reference to the sequence listing part.

[28643] GAM2055 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2055 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[28644] An enzyme complex designated DICER COMPLEX, dices the GAM2055 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2055 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 81%) nucleotide sequence of GAM2055 RNA is designated SEQ ID:4642, and is provided hereinbelow with reference to the sequence listing part.

[28645] GAM2055 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2055 target RNA, herein designated GAM TARGET RNA. GAM2055 target RNA, herein designated GAM

TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[28646] GAM2055 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2055 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2055 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2055 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2055 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[28647] The complementary binding of GAM2055 RNA, herein designated GAM RNA, to target binding sites on GAM2055 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2055 target RNA, herein designated GAM TARGET RNA, into GAM2055 target protein, herein

designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[28648] It is appreciated that GAM2055 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2055 target genes. The mRNA of each one of this plurality of GAM2055 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2055 RNA, herein designated GAM RNA, and which when bound by GAM2055 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2055 target proteins.

[28649] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2055 gene, herein designated GAM GENE, on one or more GAM2055 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[28650] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2055 correlate with, and may be deduced from, the identity of the target

genes which GAM2055 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[28651] Nucleotide sequences of the GAM2055 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2055 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2055 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2055 are further described hereinbelow with reference to Table 1.

[28652] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2055 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[28653] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2056 (GAM2056) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[28654] GAM2056 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2056 was detected is described hereinabove with reference to Figs. 2-8.

[28655] GAM2056 gene, herein designated GAM GENE, and GAM2056 target gene, herein designated GAM TARGET GENE, are human genes contained in the

human genome.

[28656] GAM2056 gene, herein designated GAM GENE, encodes a GAM2056 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2056 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2056 precursor RNA is designated SEQ ID:2033, and is provided hereinbelow with reference to the sequence listing part.

[28657] GAM2056 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2056 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[28658] An enzyme complex designated DICER COMPLEX, dices the GAM2056 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2056 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 87%) nucleotide sequence of GAM2056 RNA is designated SEQ ID:4644, and is provided

hereinbelow with reference to the sequence listing part.

[28659] GAM2056 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2056 target RNA, herein designated GAM TARGET RNA. GAM2056 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[28660] GAM2056 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2056 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2056 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2056 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2056 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[28661] The complementary binding of GAM2056 RNA, herein designated GAM RNA, to target binding sites on GAM2056 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2056 target RNA, herein designated GAM TARGET RNA, into GAM2056 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[28662] It is appreciated that GAM2056 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2056 target genes. The mRNA of each one of this plurality of GAM2056 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2056 RNA, herein designated GAM RNA, and which when bound by GAM2056 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2056 target proteins.

[28663] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2056 gene, herein designated GAM GENE, on one or more GAM2056 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding

sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[28664] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2056 correlate with, and may be deduced from, the identity of the target genes which GAM2056 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[28665] Nucleotide sequences of the GAM2056 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2056 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2056 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2056 are further described hereinbelow with reference to Table 1.

[28666] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2056 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[28667] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2057 (GAM2057) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[28668] GAM2057 is a novel bioinformatically detected regulatory, non protein

coding, micro RNA (miRNA) gene. The method by which GAM2057 was detected is described hereinabove with reference to Figs. 2-8.

[28669] GAM2057 gene, herein designated GAM GENE, and GAM2057 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[28670] GAM2057 gene, herein designated GAM GENE, encodes a GAM2057 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2057 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2057 precursor RNA is designated SEQ ID:2034, and is provided hereinbelow with reference to the sequence listing part.

[28671] GAM2057 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2057 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[28672] An enzyme complex designated DICER COMPLEX, dices the GAM2057 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2057 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin

structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 86%) nucleotide sequence of GAM2057 RNA is designated SEQ ID:4645, and is provided hereinbelow with reference to the sequence listing part.

[28673] GAM2057 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2057 target RNA, herein designated GAM TARGET RNA. GAM2057 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[28674] GAM2057 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2057 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2057 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2057 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2057 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target

binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[28675] The complementary binding of GAM2057 RNA, herein designated GAM RNA, to target binding sites on GAM2057 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2057 target RNA, herein designated GAM TARGET RNA, into GAM2057 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[28676] It is appreciated that GAM2057 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2057 target genes. The mRNA of each one of this plurality of GAM2057 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2057 RNA, herein designated GAM RNA, and which when bound by GAM2057 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2057 target proteins.

[28677] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2057 gene, herein designated GAM GENE, on one or more GAM2057 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary

binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[28678] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2057 correlate with, and may be deduced from, the identity of the target genes which GAM2057 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[28679] Nucleotide sequences of the GAM2057 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2057 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2057 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2057 are further described hereinbelow with reference to Table 1.

[28680] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2057 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[28681] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2058 (GAM2058) gene, which modulates

expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[28682] GAM2058 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2058 was detected is described hereinabove with reference to Figs. 2-8.

[28683] GAM2058 gene, herein designated GAM GENE, and GAM2058 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[28684] GAM2058 gene, herein designated GAM GENE, encodes a GAM2058 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2058 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2058 precursor RNA is designated SEQ ID:2035, and is provided hereinbelow with reference to the sequence listing part.

[28685] GAM2058 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2058 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[28686] An enzyme complex designated DICER COMPLEX, dices the GAM2058 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2058 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM2058 RNA is designated SEQ ID:4646, and is provided hereinbelow with reference to the sequence listing part.

[28687] GAM2058 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2058 target RNA, herein designated GAM TARGET RNA. GAM2058 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[28688] GAM2058 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2058 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2058 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an

illustration only, and is not meant to be limiting GAM2058 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2058 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[28689] The complementary binding of GAM2058 RNA, herein designated GAM RNA, to target binding sites on GAM2058 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2058 target RNA, herein designated GAM TARGET RNA, into GAM2058 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[28690] It is appreciated that GAM2058 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2058 target genes. The mRNA of each one of this plurality of GAM2058 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2058 RNA, herein designated GAM RNA, and which when bound by GAM2058 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2058 target proteins.

[28691] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition

exerted by GAM2058 gene, herein designated GAM GENE, on one or more GAM2058 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[28692] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2058 correlate with, and may be deduced from, the identity of the target genes which GAM2058 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[28693] Nucleotide sequences of the GAM2058 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2058 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2058 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2058 are further described hereinbelow with reference to Table 1.

[28694] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2058 RNA, herein designated GAM RNA, are described hereinbelow

with reference to Table 2.

[28695] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2059 (GAM2059) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[28696] GAM2059 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2059 was detected is described hereinabove with reference to Figs. 2-8.

[28697] GAM2059 gene, herein designated GAM GENE, and GAM2059 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[28698] GAM2059 gene, herein designated GAM GENE, encodes a GAM2059 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2059 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2059 precursor RNA is designated SEQ ID:2036, and is provided hereinbelow with reference to the sequence listing part.

[28699] GAM2059 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2059 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA

encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[28700] An enzyme complex designated DICER COMPLEX, dices the GAM2059 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2059 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 86%) nucleotide sequence of GAM2059 RNA is designated SEQ ID:4647, and is provided hereinbelow with reference to the sequence listing part.

[28701] GAM2059 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2059 target RNA, herein designated GAM TARGET RNA. GAM2059 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[28702] GAM2059 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2059 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2059 RNA,

herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2059 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2059 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[28703] The complementary binding of GAM2059 RNA, herein designated GAM RNA, to target binding sites on GAM2059 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2059 target RNA, herein designated GAM TARGET RNA, into GAM2059 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[28704] It is appreciated that GAM2059 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2059 target genes. The mRNA of each one of this plurality of GAM2059 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2059 RNA, herein designated GAM RNA, and which when bound by GAM2059 RNA, herein designated GAM RNA,

causes inhibition of translation of respective one or more GAM2059 target proteins.

[28705] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2059 gene, herein designated GAM GENE, on one or more GAM2059 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[28706] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2059 correlate with, and may be deduced from, the identity of the target genes which GAM2059 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[28707] Nucleotide sequences of the GAM2059 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2059 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2059 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2059 are further described hereinbelow with reference to Table 1.

[28708] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2059 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[28709] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2060 (GAM2060) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[28710] GAM2060 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2060 was detected is described hereinabove with reference to Figs. 2-8.

[28711] GAM2060 gene, herein designated GAM GENE, and GAM2060 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[28712] GAM2060 gene, herein designated GAM GENE, encodes a GAM2060 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2060 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2060 precursor RNA is designated SEQ ID:2037, and is provided hereinbelow with reference to the sequence listing part.

[28713] GAM2060 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2060 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[28714] An enzyme complex designated DICER COMPLEX, dices the GAM2060 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2060 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 84%) nucleotide sequence of GAM2060 RNA is designated SEQ ID:4648, and is provided hereinbelow with reference to the sequence listing part.

[28715] GAM2060 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2060 target RNA, herein designated GAM TARGET RNA. GAM2060 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[28716] GAM2060 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2060 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2060 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2060 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2060 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[28717] The complementary binding of GAM2060 RNA, herein designated GAM RNA, to target binding sites on GAM2060 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2060 target RNA, herein designated GAM TARGET RNA, into GAM2060 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[28718] It is appreciated that GAM2060 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2060 target genes. The

mRNA of each one of this plurality of GAM2060 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2060 RNA, herein designated GAM RNA, and which when bound by GAM2060 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2060 target proteins.

[28719] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2060 gene, herein designated GAM GENE, on one or more GAM2060 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[28720] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2060 correlate with, and may be deduced from, the identity of the target genes which GAM2060 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[28721] Nucleotide sequences of the GAM2060 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2060 RNA, herein

designated GAM RNA, and a schematic representation of the secondary folding of GAM2060 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2060 are further described hereinbelow with reference to Table 1.

[28722] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2060 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[28723] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2061 (GAM2061) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[28724] GAM2061 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2061 was detected is described hereinabove with reference to Figs. 2-8.

[28725] GAM2061 gene, herein designated GAM GENE, and GAM2061 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[28726] GAM2061 gene, herein designated GAM GENE, encodes a GAM2061 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2061 precursor RNA,

herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2061 precursor RNA is designated SEQ ID:2038, and is provided hereinbelow with reference to the sequence listing part.

[28727] GAM2061 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2061 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[28728] An enzyme complex designated DICER COMPLEX, dices the GAM2061 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2061 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 93%) nucleotide sequence of GAM2061 RNA is designated SEQ ID:4649, and is provided hereinbelow with reference to the sequence listing part.

[28729] GAM2061 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2061 target RNA, herein designated GAM TARGET RNA. GAM2061 target RNA, herein designated GAM

TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[28730] GAM2061 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2061 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2061 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2061 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2061 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[28731] The complementary binding of GAM2061 RNA, herein designated GAM RNA, to target binding sites on GAM2061 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2061 target RNA, herein designated GAM TARGET RNA, into GAM2061 target protein, herein

designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[28732] It is appreciated that GAM2061 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2061 target genes. The mRNA of each one of this plurality of GAM2061 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2061 RNA, herein designated GAM RNA, and which when bound by GAM2061 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2061 target proteins.

[28733] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2061 gene, herein designated GAM GENE, on one or more GAM2061 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[28734] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2061 correlate with, and may be deduced from, the identity of the target

genes which GAM2061 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[28735] Nucleotide sequences of the GAM2061 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2061 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2061 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2061 are further described hereinbelow with reference to Table 1.

[28736] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2061 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[28737] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2062 (GAM2062) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[28738] GAM2062 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2062 was detected is described hereinabove with reference to Figs. 2-8.

[28739] GAM2062 gene, herein designated GAM GENE, and GAM2062 target gene, herein designated GAM TARGET GENE, are human genes contained in the

human genome.

[28740] GAM2062 gene, herein designated GAM GENE, encodes a GAM2062 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2062 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2062 precursor RNA is designated SEQ ID:2039, and is provided hereinbelow with reference to the sequence listing part.

[28741] GAM2062 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2062 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[28742] An enzyme complex designated DICER COMPLEX, dices the GAM2062 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2062 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 76%) nucleotide sequence of GAM2062 RNA is designated SEQ ID:4650, and is provided

hereinbelow with reference to the sequence listing part.

[28743] GAM2062 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2062 target RNA, herein designated GAM TARGET RNA. GAM2062 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[28744] GAM2062 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2062 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2062 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2062 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2062 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[28745] The complementary binding of GAM2062 RNA, herein designated GAM RNA, to target binding sites on GAM2062 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2062 target RNA, herein designated GAM TARGET RNA, into GAM2062 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[28746] It is appreciated that GAM2062 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2062 target genes. The mRNA of each one of this plurality of GAM2062 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2062 RNA, herein designated GAM RNA, and which when bound by GAM2062 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2062 target proteins.

[28747] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2062 gene, herein designated GAM GENE, on one or more GAM2062 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding

sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[28748] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2062 correlate with, and may be deduced from, the identity of the target genes which GAM2062 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[28749] Nucleotide sequences of the GAM2062 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2062 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2062 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2062 are further described hereinbelow with reference to Table 1.

[28750] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2062 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[28751] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2063 (GAM2063) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[28752] GAM2063 is a novel bioinformatically detected regulatory, non protein

coding, micro RNA (miRNA) gene. The method by which GAM2063 was detected is described hereinabove with reference to Figs. 2-8.

[28753] GAM2063 gene, herein designated GAM GENE, and GAM2063 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[28754] GAM2063 gene, herein designated GAM GENE, encodes a GAM2063 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2063 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2063 precursor RNA is designated SEQ ID:2040, and is provided hereinbelow with reference to the sequence listing part.

[28755] GAM2063 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2063 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[28756] An enzyme complex designated DICER COMPLEX, dices the GAM2063 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2063 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin

structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 90%) nucleotide sequence of GAM2063 RNA is designated SEQ ID:4651, and is provided hereinbelow with reference to the sequence listing part.

[28757] GAM2063 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2063 target RNA, herein designated GAM TARGET RNA. GAM2063 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[28758] GAM2063 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2063 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2063 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2063 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2063 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target

binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[28759] The complementary binding of GAM2063 RNA, herein designated GAM RNA, to target binding sites on GAM2063 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2063 target RNA, herein designated GAM TARGET RNA, into GAM2063 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[28760] It is appreciated that GAM2063 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2063 target genes. The mRNA of each one of this plurality of GAM2063 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2063 RNA, herein designated GAM RNA, and which when bound by GAM2063 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2063 target proteins.

[28761] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2063 gene, herein designated GAM GENE, on one or more GAM2063 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary

binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[28762] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2063 correlate with, and may be deduced from, the identity of the target genes which GAM2063 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[28763] Nucleotide sequences of the GAM2063 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2063 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2063 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2063 are further described hereinbelow with reference to Table 1.

[28764] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2063 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[28765] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2064 (GAM2064) gene, which modulates

expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[28766] GAM2064 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2064 was detected is described hereinabove with reference to Figs. 2-8.

[28767] GAM2064 gene, herein designated GAM GENE, and GAM2064 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[28768] GAM2064 gene, herein designated GAM GENE, encodes a GAM2064 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2064 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2064 precursor RNA is designated SEQ ID:2041, and is provided hereinbelow with reference to the sequence listing part.

[28769] GAM2064 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2064 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[28770] An enzyme complex designated DICER COMPLEX, dices the GAM2064 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2064 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM2064 RNA is designated SEQ ID:4652, and is provided hereinbelow with reference to the sequence listing part.

[28771] GAM2064 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2064 target RNA, herein designated GAM TARGET RNA. GAM2064 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[28772] GAM2064 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2064 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2064 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an

illustration only, and is not meant to be limiting GAM2064 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2064 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[28773] The complementary binding of GAM2064 RNA, herein designated GAM RNA, to target binding sites on GAM2064 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2064 target RNA, herein designated GAM TARGET RNA, into GAM2064 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[28774] It is appreciated that GAM2064 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2064 target genes. The mRNA of each one of this plurality of GAM2064 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2064 RNA, herein designated GAM RNA, and which when bound by GAM2064 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2064 target proteins.

[28775] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition

exerted by GAM2064 gene, herein designated GAM GENE, on one or more GAM2064 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[28776] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2064 correlate with, and may be deduced from, the identity of the target genes which GAM2064 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[28777] Nucleotide sequences of the GAM2064 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2064 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2064 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2064 are further described hereinbelow with reference to Table 1.

[28778] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2064 RNA, herein designated GAM RNA, are described hereinbelow

with reference to Table 2.

[28779] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2065 (GAM2065) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[28780] GAM2065 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2065 was detected is described hereinabove with reference to Figs. 2-8.

[28781] GAM2065 gene, herein designated GAM GENE, and GAM2065 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[28782] GAM2065 gene, herein designated GAM GENE, encodes a GAM2065 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2065 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2065 precursor RNA is designated SEQ ID:2042, and is provided hereinbelow with reference to the sequence listing part.

[28783] GAM2065 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2065 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA

encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[28784] An enzyme complex designated DICER COMPLEX, dices the GAM2065 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2065 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 83%) nucleotide sequence of GAM2065 RNA is designated SEQ ID:4653, and is provided hereinbelow with reference to the sequence listing part.

[28785] GAM2065 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2065 target RNA, herein designated GAM TARGET RNA. GAM2065 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[28786] GAM2065 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2065 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2065 RNA,

herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2065 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2065 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[28787] The complementary binding of GAM2065 RNA, herein designated GAM RNA, to target binding sites on GAM2065 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2065 target RNA, herein designated GAM TARGET RNA, into GAM2065 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[28788] It is appreciated that GAM2065 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2065 target genes. The mRNA of each one of this plurality of GAM2065 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2065 RNA, herein designated GAM RNA, and which when bound by GAM2065 RNA, herein designated GAM RNA,

causes inhibition of translation of respective one or more GAM2065 target proteins.

[28789] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2065 gene, herein designated GAM GENE, on one or more GAM2065 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[28790] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2065 correlate with, and may be deduced from, the identity of the target genes which GAM2065 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[28791] Nucleotide sequences of the GAM2065 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2065 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2065 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2065 are further described hereinbelow with reference to Table 1.

[28792] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2065 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[28793] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2066 (GAM2066) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[28794] GAM2066 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2066 was detected is described hereinabove with reference to Figs. 2-8.

[28795] GAM2066 gene, herein designated GAM GENE, and GAM2066 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[28796] GAM2066 gene, herein designated GAM GENE, encodes a GAM2066 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2066 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2066 precursor RNA is designated SEQ ID:2043, and is provided hereinbelow with reference to the sequence listing part.

[28797] GAM2066 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2066 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[28798] An enzyme complex designated DICER COMPLEX, dices the GAM2066 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2066 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 82%) nucleotide sequence of GAM2066 RNA is designated SEQ ID:4654, and is provided hereinbelow with reference to the sequence listing part.

[28799] GAM2066 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2066 target RNA, herein designated GAM TARGET RNA. GAM2066 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[28800] GAM2066 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2066 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2066 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2066 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2066 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[28801] The complementary binding of GAM2066 RNA, herein designated GAM RNA, to target binding sites on GAM2066 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2066 target RNA, herein designated GAM TARGET RNA, into GAM2066 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[28802] It is appreciated that GAM2066 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2066 target genes. The

mRNA of each one of this plurality of GAM2066 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2066 RNA, herein designated GAM RNA, and which when bound by GAM2066 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2066 target proteins.

[28803] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2066 gene, herein designated GAM GENE, on one or more GAM2066 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[28804] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2066 correlate with, and may be deduced from, the identity of the target genes which GAM2066 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[28805] Nucleotide sequences of the GAM2066 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2066 RNA, herein

designated GAM RNA, and a schematic representation of the secondary folding of GAM2066 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2066 are further described hereinbelow with reference to Table 1.

[28806] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2066 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[28807] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2067 (GAM2067) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[28808] GAM2067 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2067 was detected is described hereinabove with reference to Figs. 2-8.

[28809] GAM2067 gene, herein designated GAM GENE, and GAM2067 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[28810] GAM2067 gene, herein designated GAM GENE, encodes a GAM2067 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2067 precursor RNA,

herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2067 precursor RNA is designated SEQ ID:2044, and is provided hereinbelow with reference to the sequence listing part.

[28811] GAM2067 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2067 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[28812] An enzyme complex designated DICER COMPLEX, dices the GAM2067 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2067 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 87%) nucleotide sequence of GAM2067 RNA is designated SEQ ID:4655, and is provided hereinbelow with reference to the sequence listing part.

[28813] GAM2067 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2067 target RNA, herein designated GAM TARGET RNA. GAM2067 target RNA, herein designated GAM

TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[28814] GAM2067 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2067 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2067 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2067 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2067 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[28815] The complementary binding of GAM2067 RNA, herein designated GAM RNA, to target binding sites on GAM2067 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2067 target RNA, herein designated GAM TARGET RNA, into GAM2067 target protein, herein

designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[28816] It is appreciated that GAM2067 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2067 target genes. The mRNA of each one of this plurality of GAM2067 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2067 RNA, herein designated GAM RNA, and which when bound by GAM2067 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2067 target proteins.

[28817] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2067 gene, herein designated GAM GENE, on one or more GAM2067 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[28818] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2067 correlate with, and may be deduced from, the identity of the target

genes which GAM2067 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[28819] Nucleotide sequences of the GAM2067 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2067 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2067 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2067 are further described hereinbelow with reference to Table 1.

[28820] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2067 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[28821] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2068 (GAM2068) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[28822] GAM2068 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2068 was detected is described hereinabove with reference to Figs. 2-8.

[28823] GAM2068 gene, herein designated GAM GENE, and GAM2068 target gene, herein designated GAM TARGET GENE, are human genes contained in the

human genome.

[28824] GAM2068 gene, herein designated GAM GENE, encodes a GAM2068 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2068 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2068 precursor RNA is designated SEQ ID:2045, and is provided hereinbelow with reference to the sequence listing part.

[28825] GAM2068 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2068 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[28826] An enzyme complex designated DICER COMPLEX, dices the GAM2068 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2068 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 87%) nucleotide sequence of GAM2068 RNA is designated SEQ ID:4656, and is provided

hereinbelow with reference to the sequence listing part.

[28827] GAM2068 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2068 target RNA, herein designated GAM TARGET RNA. GAM2068 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[28828] GAM2068 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2068 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2068 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2068 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2068 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[28829] The complementary binding of GAM2068 RNA, herein designated GAM RNA, to target binding sites on GAM2068 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2068 target RNA, herein designated GAM TARGET RNA, into GAM2068 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[28830] It is appreciated that GAM2068 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2068 target genes. The mRNA of each one of this plurality of GAM2068 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2068 RNA, herein designated GAM RNA, and which when bound by GAM2068 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2068 target proteins.

[28831] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2068 gene, herein designated GAM GENE, on one or more GAM2068 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding

sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[28832] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2068 correlate with, and may be deduced from, the identity of the target genes which GAM2068 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[28833] Nucleotide sequences of the GAM2068 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2068 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2068 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2068 are further described hereinbelow with reference to Table 1.

[28834] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2068 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[28835] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2069 (GAM2069) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[28836] GAM2069 is a novel bioinformatically detected regulatory, non protein

coding, micro RNA (miRNA) gene. The method by which GAM2069 was detected is described hereinabove with reference to Figs. 2-8.

[28837] GAM2069 gene, herein designated GAM GENE, and GAM2069 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[28838] GAM2069 gene, herein designated GAM GENE, encodes a GAM2069 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2069 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2069 precursor RNA is designated SEQ ID:2046, and is provided hereinbelow with reference to the sequence listing part.

[28839] GAM2069 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2069 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[28840] An enzyme complex designated DICER COMPLEX, dices the GAM2069 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2069 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin

structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 85%) nucleotide sequence of GAM2069 RNA is designated SEQ ID:4657, and is provided hereinbelow with reference to the sequence listing part.

[28841] GAM2069 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2069 target RNA, herein designated GAM TARGET RNA. GAM2069 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[28842] GAM2069 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2069 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2069 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2069 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2069 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target

binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[28843] The complementary binding of GAM2069 RNA, herein designated GAM RNA, to target binding sites on GAM2069 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2069 target RNA, herein designated GAM TARGET RNA, into GAM2069 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[28844] It is appreciated that GAM2069 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2069 target genes. The mRNA of each one of this plurality of GAM2069 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2069 RNA, herein designated GAM RNA, and which when bound by GAM2069 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2069 target proteins.

[28845] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2069 gene, herein designated GAM GENE, on one or more GAM2069 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary

binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[28846] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2069 correlate with, and may be deduced from, the identity of the target genes which GAM2069 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[28847] Nucleotide sequences of the GAM2069 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2069 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2069 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2069 are further described hereinbelow with reference to Table 1.

[28848] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2069 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[28849] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2070 (GAM2070) gene, which modulates

expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[28850] GAM2070 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2070 was detected is described hereinabove with reference to Figs. 2-8.

[28851] GAM2070 gene, herein designated GAM GENE, and GAM2070 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[28852] GAM2070 gene, herein designated GAM GENE, encodes a GAM2070 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2070 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2070 precursor RNA is designated SEQ ID:2047, and is provided hereinbelow with reference to the sequence listing part.

[28853] GAM2070 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2070 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[28854] An enzyme complex designated DICER COMPLEX, dices the GAM2070 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2070 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 82%) nucleotide sequence of GAM2070 RNA is designated SEQ ID:4658, and is provided hereinbelow with reference to the sequence listing part.

[28855] GAM2070 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2070 target RNA, herein designated GAM TARGET RNA. GAM2070 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[28856] GAM2070 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2070 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2070 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an

illustration only, and is not meant to be limiting GAM2070 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2070 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[28857] The complementary binding of GAM2070 RNA, herein designated GAM RNA, to target binding sites on GAM2070 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2070 target RNA, herein designated GAM TARGET RNA, into GAM2070 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[28858] It is appreciated that GAM2070 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2070 target genes. The mRNA of each one of this plurality of GAM2070 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2070 RNA, herein designated GAM RNA, and which when bound by GAM2070 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2070 target proteins.

[28859] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition

exerted by GAM2070 gene, herein designated GAM GENE, on one or more GAM2070 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[28860] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2070 correlate with, and may be deduced from, the identity of the target genes which GAM2070 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[28861] Nucleotide sequences of the GAM2070 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2070 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2070 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2070 are further described hereinbelow with reference to Table 1.

[28862] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2070 RNA, herein designated GAM RNA, are described hereinbelow

with reference to Table 2.

[28863] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2071 (GAM2071) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[28864] GAM2071 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2071 was detected is described hereinabove with reference to Figs. 2-8.

[28865] GAM2071 gene, herein designated GAM GENE, and GAM2071 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[28866] GAM2071 gene, herein designated GAM GENE, encodes a GAM2071 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2071 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2071 precursor RNA is designated SEQ ID:2048, and is provided hereinbelow with reference to the sequence listing part.

[28867] GAM2071 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2071 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA

encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[28868] An enzyme complex designated DICER COMPLEX, dices the GAM2071 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2071 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 87%) nucleotide sequence of GAM2071 RNA is designated SEQ ID:4659, and is provided hereinbelow with reference to the sequence listing part.

[28869] GAM2071 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2071 target RNA, herein designated GAM TARGET RNA. GAM2071 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[28870] GAM2071 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2071 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2071 RNA,

herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2071 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2071 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[28871] The complementary binding of GAM2071 RNA, herein designated GAM RNA, to target binding sites on GAM2071 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2071 target RNA, herein designated GAM TARGET RNA, into GAM2071 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[28872] It is appreciated that GAM2071 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2071 target genes. The mRNA of each one of this plurality of GAM2071 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2071 RNA, herein designated GAM RNA, and which when bound by GAM2071 RNA, herein designated GAM RNA,

causes inhibition of translation of respective one or more GAM2071 target proteins.

[28873] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2071 gene, herein designated GAM GENE, on one or more GAM2071 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[28874] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2071 correlate with, and may be deduced from, the identity of the target genes which GAM2071 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[28875] Nucleotide sequences of the GAM2071 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2071 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2071 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2071 are further described hereinbelow with reference to Table 1.

[28876] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2071 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[28877] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2072 (GAM2072) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[28878] GAM2072 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2072 was detected is described hereinabove with reference to Figs. 2-8.

[28879] GAM2072 gene, herein designated GAM GENE, and GAM2072 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[28880] GAM2072 gene, herein designated GAM GENE, encodes a GAM2072 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2072 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2072 precursor RNA is designated SEQ ID:2049, and is provided hereinbelow with reference to the sequence listing part.

[28881] GAM2072 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2072 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[28882] An enzyme complex designated DICER COMPLEX, dices the GAM2072 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2072 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 86%) nucleotide sequence of GAM2072 RNA is designated SEQ ID:4660, and is provided hereinbelow with reference to the sequence listing part.

[28883] GAM2072 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2072 target RNA, herein designated GAM TARGET RNA. GAM2072 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[28884] GAM2072 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2072 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2072 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2072 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2072 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[28885] The complementary binding of GAM2072 RNA, herein designated GAM RNA, to target binding sites on GAM2072 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2072 target RNA, herein designated GAM TARGET RNA, into GAM2072 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[28886] It is appreciated that GAM2072 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2072 target genes. The

mRNA of each one of this plurality of GAM2072 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2072 RNA, herein designated GAM RNA, and which when bound by GAM2072 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2072 target proteins.

[28887] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2072 gene, herein designated GAM GENE, on one or more GAM2072 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[28888] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2072 correlate with, and may be deduced from, the identity of the target genes which GAM2072 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[28889] Nucleotide sequences of the GAM2072 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2072 RNA, herein

designated GAM RNA, and a schematic representation of the secondary folding of GAM2072 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2072 are further described hereinbelow with reference to Table 1.

[28890] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2072 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[28891] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2073 (GAM2073) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[28892] GAM2073 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2073 was detected is described hereinabove with reference to Figs. 2-8.

[28893] GAM2073 gene, herein designated GAM GENE, and GAM2073 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[28894] GAM2073 gene, herein designated GAM GENE, encodes a GAM2073 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2073 precursor RNA,

herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2073 precursor RNA is designated SEQ ID:2050, and is provided hereinbelow with reference to the sequence listing part.

[28895] GAM2073 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2073 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[28896] An enzyme complex designated DICER COMPLEX, dices the GAM2073 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2073 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 79%) nucleotide sequence of GAM2073 RNA is designated SEQ ID:4661, and is provided hereinbelow with reference to the sequence listing part.

[28897] GAM2073 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2073 target RNA, herein designated GAM TARGET RNA. GAM2073 target RNA, herein designated GAM

TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[28898] GAM2073 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2073 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2073 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2073 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2073 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[28899] The complementary binding of GAM2073 RNA, herein designated GAM RNA, to target binding sites on GAM2073 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2073 target RNA, herein designated GAM TARGET RNA, into GAM2073 target protein, herein

designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[28900] It is appreciated that GAM2073 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2073 target genes. The mRNA of each one of this plurality of GAM2073 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2073 RNA, herein designated GAM RNA, and which when bound by GAM2073 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2073 target proteins.

[28901] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2073 gene, herein designated GAM GENE, on one or more GAM2073 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[28902] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2073 correlate with, and may be deduced from, the identity of the target

genes which GAM2073 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[28903] Nucleotide sequences of the GAM2073 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2073 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2073 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2073 are further described hereinbelow with reference to Table 1.

[28904] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2073 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[28905] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2074 (GAM2074) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[28906] GAM2074 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2074 was detected is described hereinabove with reference to Figs. 2-8.

[28907] GAM2074 gene, herein designated GAM GENE, and GAM2074 target gene, herein designated GAM TARGET GENE, are human genes contained in the

human genome.

[28908] GAM2074 gene, herein designated GAM GENE, encodes a GAM2074 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2074 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2074 precursor RNA is designated SEQ ID:2051, and is provided hereinbelow with reference to the sequence listing part.

[28909] GAM2074 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2074 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[28910] An enzyme complex designated DICER COMPLEX, dices the GAM2074 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2074 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 81%) nucleotide sequence of GAM2074 RNA is designated SEQ ID:4662, and is provided

hereinbelow with reference to the sequence listing part.

[28911] GAM2074 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2074 target RNA, herein designated GAM TARGET RNA. GAM2074 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[28912] GAM2074 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2074 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2074 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2074 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2074 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[28913] The complementary binding of GAM2074 RNA, herein designated GAM RNA, to target binding sites on GAM2074 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2074 target RNA, herein designated GAM TARGET RNA, into GAM2074 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[28914] It is appreciated that GAM2074 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2074 target genes. The mRNA of each one of this plurality of GAM2074 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2074 RNA, herein designated GAM RNA, and which when bound by GAM2074 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2074 target proteins.

[28915] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2074 gene, herein designated GAM GENE, on one or more GAM2074 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding

sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[28916] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2074 correlate with, and may be deduced from, the identity of the target genes which GAM2074 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[28917] Nucleotide sequences of the GAM2074 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2074 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2074 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2074 are further described hereinbelow with reference to Table 1.

[28918] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2074 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[28919] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2075 (GAM2075) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[28920] GAM2075 is a novel bioinformatically detected regulatory, non protein

coding, micro RNA (miRNA) gene. The method by which GAM2075 was detected is described hereinabove with reference to Figs. 2-8.

[28921] GAM2075 gene, herein designated GAM GENE, and GAM2075 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[28922] GAM2075 gene, herein designated GAM GENE, encodes a GAM2075 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2075 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2075 precursor RNA is designated SEQ ID:2052, and is provided hereinbelow with reference to the sequence listing part.

[28923] GAM2075 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2075 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[28924] An enzyme complex designated DICER COMPLEX, dices the GAM2075 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2075 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin

structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 87%) nucleotide sequence of GAM2075 RNA is designated SEQ ID:4663, and is provided hereinbelow with reference to the sequence listing part.

[28925] GAM2075 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2075 target RNA, herein designated GAM TARGET RNA. GAM2075 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[28926] GAM2075 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2075 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2075 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2075 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2075 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target

binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[28927] The complementary binding of GAM2075 RNA, herein designated GAM RNA, to target binding sites on GAM2075 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2075 target RNA, herein designated GAM TARGET RNA, into GAM2075 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[28928] It is appreciated that GAM2075 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2075 target genes. The mRNA of each one of this plurality of GAM2075 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2075 RNA, herein designated GAM RNA, and which when bound by GAM2075 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2075 target proteins.

[28929] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2075 gene, herein designated GAM GENE, on one or more GAM2075 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary

binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[28930] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2075 correlate with, and may be deduced from, the identity of the target genes which GAM2075 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[28931] Nucleotide sequences of the GAM2075 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2075 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2075 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2075 are further described hereinbelow with reference to Table 1.

[28932] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2075 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[28933] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2076 (GAM2076) gene, which modulates

expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[28934] GAM2076 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2076 was detected is described hereinabove with reference to Figs. 2-8.

[28935] GAM2076 gene, herein designated GAM GENE, and GAM2076 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[28936] GAM2076 gene, herein designated GAM GENE, encodes a GAM2076 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2076 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2076 precursor RNA is designated SEQ ID:2053, and is provided hereinbelow with reference to the sequence listing part.

[28937] GAM2076 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2076 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[28938] An enzyme complex designated DICER COMPLEX, dices the GAM2076 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2076 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM2076 RNA is designated SEQ ID:4664, and is provided hereinbelow with reference to the sequence listing part.

[28939] GAM2076 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2076 target RNA, herein designated GAM TARGET RNA. GAM2076 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[28940] GAM2076 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2076 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2076 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an

illustration only, and is not meant to be limiting GAM2076 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2076 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[28941] The complementary binding of GAM2076 RNA, herein designated GAM RNA, to target binding sites on GAM2076 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2076 target RNA, herein designated GAM TARGET RNA, into GAM2076 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[28942] It is appreciated that GAM2076 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2076 target genes. The mRNA of each one of this plurality of GAM2076 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2076 RNA, herein designated GAM RNA, and which when bound by GAM2076 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2076 target proteins.

[28943] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition

exerted by GAM2076 gene, herein designated GAM GENE, on one or more GAM2076 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[28944] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2076 correlate with, and may be deduced from, the identity of the target genes which GAM2076 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[28945] Nucleotide sequences of the GAM2076 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2076 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2076 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2076 are further described hereinbelow with reference to Table 1.

[28946] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2076 RNA, herein designated GAM RNA, are described hereinbelow

with reference to Table 2.

[28947] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2077 (GAM2077) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[28948] GAM2077 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2077 was detected is described hereinabove with reference to Figs. 2-8.

[28949] GAM2077 gene, herein designated GAM GENE, and GAM2077 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[28950] GAM2077 gene, herein designated GAM GENE, encodes a GAM2077 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2077 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2077 precursor RNA is designated SEQ ID:2054, and is provided hereinbelow with reference to the sequence listing part.

[28951] GAM2077 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2077 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA

encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[28952] An enzyme complex designated DICER COMPLEX, dices the GAM2077 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2077 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 84%) nucleotide sequence of GAM2077 RNA is designated SEQ ID:4665, and is provided hereinbelow with reference to the sequence listing part.

[28953] GAM2077 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2077 target RNA, herein designated GAM TARGET RNA. GAM2077 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[28954] GAM2077 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2077 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2077 RNA,

herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2077 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2077 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[28955] The complementary binding of GAM2077 RNA, herein designated GAM RNA, to target binding sites on GAM2077 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2077 target RNA, herein designated GAM TARGET RNA, into GAM2077 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[28956] It is appreciated that GAM2077 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2077 target genes. The mRNA of each one of this plurality of GAM2077 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2077 RNA, herein designated GAM RNA, and which when bound by GAM2077 RNA, herein designated GAM RNA,

causes inhibition of translation of respective one or more GAM2077 target proteins.

[28957] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2077 gene, herein designated GAM GENE, on one or more GAM2077 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[28958] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2077 correlate with, and may be deduced from, the identity of the target genes which GAM2077 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[28959] Nucleotide sequences of the GAM2077 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2077 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2077 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2077 are further described hereinbelow with reference to Table 1.

[28960] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2077 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[28961] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2078 (GAM2078) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[28962] GAM2078 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2078 was detected is described hereinabove with reference to Figs. 2-8.

[28963] GAM2078 gene, herein designated GAM GENE, and GAM2078 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[28964] GAM2078 gene, herein designated GAM GENE, encodes a GAM2078 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2078 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2078 precursor RNA is designated SEQ ID:2055, and is provided hereinbelow with reference to the sequence listing part.

[28965] GAM2078 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2078 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[28966] An enzyme complex designated DICER COMPLEX, dices the GAM2078 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2078 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 76%) nucleotide sequence of GAM2078 RNA is designated SEQ ID:4666, and is provided hereinbelow with reference to the sequence listing part.

[28967] GAM2078 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2078 target RNA, herein designated GAM TARGET RNA. GAM2078 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[28968] GAM2078 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2078 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2078 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2078 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2078 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[28969] The complementary binding of GAM2078 RNA, herein designated GAM RNA, to target binding sites on GAM2078 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2078 target RNA, herein designated GAM TARGET RNA, into GAM2078 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[28970] It is appreciated that GAM2078 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2078 target genes. The

mRNA of each one of this plurality of GAM2078 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2078 RNA, herein designated GAM RNA, and which when bound by GAM2078 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2078 target proteins.

[28971] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2078 gene, herein designated GAM GENE, on one or more GAM2078 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[28972] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2078 correlate with, and may be deduced from, the identity of the target genes which GAM2078 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[28973] Nucleotide sequences of the GAM2078 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2078 RNA, herein

designated GAM RNA, and a schematic representation of the secondary folding of GAM2078 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2078 are further described hereinbelow with reference to Table 1.

[28974] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2078 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[28975] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2079 (GAM2079) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[28976] GAM2079 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2079 was detected is described hereinabove with reference to Figs. 2-8.

[28977] GAM2079 gene, herein designated GAM GENE, and GAM2079 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[28978] GAM2079 gene, herein designated GAM GENE, encodes a GAM2079 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2079 precursor RNA,

herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2079 precursor RNA is designated SEQ ID:2056, and is provided hereinbelow with reference to the sequence listing part.

[28979] GAM2079 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2079 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[28980] An enzyme complex designated DICER COMPLEX, dices the GAM2079 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2079 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 78%) nucleotide sequence of GAM2079 RNA is designated SEQ ID:4667, and is provided hereinbelow with reference to the sequence listing part.

[28981] GAM2079 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2079 target RNA, herein designated GAM TARGET RNA. GAM2079 target RNA, herein designated GAM

TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[28982] GAM2079 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2079 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2079 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2079 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2079 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[28983] The complementary binding of GAM2079 RNA, herein designated GAM RNA, to target binding sites on GAM2079 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2079 target RNA, herein designated GAM TARGET RNA, into GAM2079 target protein, herein

designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[28984] It is appreciated that GAM2079 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2079 target genes. The mRNA of each one of this plurality of GAM2079 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2079 RNA, herein designated GAM RNA, and which when bound by GAM2079 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2079 target proteins.

[28985] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2079 gene, herein designated GAM GENE, on one or more GAM2079 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[28986] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2079 correlate with, and may be deduced from, the identity of the target

genes which GAM2079 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[28987] Nucleotide sequences of the GAM2079 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2079 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2079 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2079 are further described hereinbelow with reference to Table 1.

[28988] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2079 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[28989] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2080 (GAM2080) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[28990] GAM2080 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2080 was detected is described hereinabove with reference to Figs. 2-8.

[28991] GAM2080 gene, herein designated GAM GENE, and GAM2080 target gene, herein designated GAM TARGET GENE, are human genes contained in the

human genome.

[28992] GAM2080 gene, herein designated GAM GENE, encodes a GAM2080 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2080 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2080 precursor RNA is designated SEQ ID:2057, and is provided hereinbelow with reference to the sequence listing part.

[28993] GAM2080 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2080 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[28994] An enzyme complex designated DICER COMPLEX, dices the GAM2080 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2080 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM2080 RNA is designated SEQ ID:4668, and is provided

hereinbelow with reference to the sequence listing part.

[28995] GAM2080 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2080 target RNA, herein designated GAM TARGET RNA. GAM2080 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[28996] GAM2080 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2080 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2080 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2080 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2080 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[28997] The complementary binding of GAM2080 RNA, herein designated GAM RNA, to target binding sites on GAM2080 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2080 target RNA, herein designated GAM TARGET RNA, into GAM2080 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[28998] It is appreciated that GAM2080 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2080 target genes. The mRNA of each one of this plurality of GAM2080 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2080 RNA, herein designated GAM RNA, and which when bound by GAM2080 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2080 target proteins.

[28999] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2080 gene, herein designated GAM GENE, on one or more GAM2080 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding

sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[29000] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2080 correlate with, and may be deduced from, the identity of the target genes which GAM2080 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[29001] Nucleotide sequences of the GAM2080 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2080 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2080 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2080 are further described hereinbelow with reference to Table 1.

[29002] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2080 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[29003] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2081 (GAM2081) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[29004] GAM2081 is a novel bioinformatically detected regulatory, non protein

coding, micro RNA (miRNA) gene. The method by which GAM2081 was detected is described hereinabove with reference to Figs. 2-8.

[29005] GAM2081 gene, herein designated GAM GENE, and GAM2081 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[29006] GAM2081 gene, herein designated GAM GENE, encodes a GAM2081 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2081 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2081 precursor RNA is designated SEQ ID:2058, and is provided hereinbelow with reference to the sequence listing part.

[29007] GAM2081 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2081 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[29008] An enzyme complex designated DICER COMPLEX, dices the GAM2081 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2081 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin

structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM2081 RNA is designated SEQ ID:4669, and is provided hereinbelow with reference to the sequence listing part.

[29009] GAM2081 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2081 target RNA, herein designated GAM TARGET RNA. GAM2081 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[29010] GAM2081 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2081 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2081 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2081 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2081 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target

binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[29011] The complementary binding of GAM2081 RNA, herein designated GAM RNA, to target binding sites on GAM2081 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2081 target RNA, herein designated GAM TARGET RNA, into GAM2081 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[29012] It is appreciated that GAM2081 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2081 target genes. The mRNA of each one of this plurality of GAM2081 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2081 RNA, herein designated GAM RNA, and which when bound by GAM2081 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2081 target proteins.

[29013] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2081 gene, herein designated GAM GENE, on one or more GAM2081 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary

binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[29014] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2081 correlate with, and may be deduced from, the identity of the target genes which GAM2081 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[29015] Nucleotide sequences of the GAM2081 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2081 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2081 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2081 are further described hereinbelow with reference to Table 1.

[29016] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2081 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[29017] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2082 (GAM2082) gene, which modulates

expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[29018] GAM2082 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2082 was detected is described hereinabove with reference to Figs. 2-8.

[29019] GAM2082 gene, herein designated GAM GENE, and GAM2082 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[29020] GAM2082 gene, herein designated GAM GENE, encodes a GAM2082 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2082 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2082 precursor RNA is designated SEQ ID:2059, and is provided hereinbelow with reference to the sequence listing part.

[29021] GAM2082 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2082 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[29022] An enzyme complex designated DICER COMPLEX, dices the GAM2082 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2082 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM2082 RNA is designated SEQ ID:4670, and is provided hereinbelow with reference to the sequence listing part.

[29023] GAM2082 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2082 target RNA, herein designated GAM TARGET RNA. GAM2082 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[29024] GAM2082 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2082 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2082 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an

illustration only, and is not meant to be limiting GAM2082 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2082 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[29025] The complementary binding of GAM2082 RNA, herein designated GAM RNA, to target binding sites on GAM2082 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2082 target RNA, herein designated GAM TARGET RNA, into GAM2082 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[29026] It is appreciated that GAM2082 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2082 target genes. The mRNA of each one of this plurality of GAM2082 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2082 RNA, herein designated GAM RNA, and which when bound by GAM2082 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2082 target proteins.

[29027] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition

exerted by GAM2082 gene, herein designated GAM GENE, on one or more GAM2082 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[29028] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2082 correlate with, and may be deduced from, the identity of the target genes which GAM2082 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[29029] Nucleotide sequences of the GAM2082 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2082 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2082 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2082 are further described hereinbelow with reference to Table 1.

[29030] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2082 RNA, herein designated GAM RNA, are described hereinbelow

with reference to Table 2.

[29031] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2083 (GAM2083) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[29032] GAM2083 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2083 was detected is described hereinabove with reference to Figs. 2-8.

[29033] GAM2083 gene, herein designated GAM GENE, and GAM2083 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[29034] GAM2083 gene, herein designated GAM GENE, encodes a GAM2083 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2083 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2083 precursor RNA is designated SEQ ID:2060, and is provided hereinbelow with reference to the sequence listing part.

[29035] GAM2083 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2083 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA

encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[29036] An enzyme complex designated DICER COMPLEX, dices the GAM2083 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2083 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 81%) nucleotide sequence of GAM2083 RNA is designated SEQ ID:4671, and is provided hereinbelow with reference to the sequence listing part.

[29037] GAM2083 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2083 target RNA, herein designated GAM TARGET RNA. GAM2083 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[29038] GAM2083 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2083 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2083 RNA,

herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2083 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2083 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[29039] The complementary binding of GAM2083 RNA, herein designated GAM RNA, to target binding sites on GAM2083 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2083 target RNA, herein designated GAM TARGET RNA, into GAM2083 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[29040] It is appreciated that GAM2083 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2083 target genes. The mRNA of each one of this plurality of GAM2083 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2083 RNA, herein designated GAM RNA, and which when bound by GAM2083 RNA, herein designated GAM RNA,

causes inhibition of translation of respective one or more GAM2083 target proteins.

[29041] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2083 gene, herein designated GAM GENE, on one or more GAM2083 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[29042] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2083 correlate with, and may be deduced from, the identity of the target genes which GAM2083 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[29043] Nucleotide sequences of the GAM2083 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2083 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2083 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2083 are further described hereinbelow with reference to Table 1.

[29044] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2083 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[29045] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2084 (GAM2084) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[29046] GAM2084 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2084 was detected is described hereinabove with reference to Figs. 2-8.

[29047] GAM2084 gene, herein designated GAM GENE, and GAM2084 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[29048] GAM2084 gene, herein designated GAM GENE, encodes a GAM2084 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2084 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2084 precursor RNA is designated SEQ ID:2061, and is provided hereinbelow with reference to the sequence listing part.

[29049] GAM2084 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2084 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[29050] An enzyme complex designated DICER COMPLEX, dices the GAM2084 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2084 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 87%) nucleotide sequence of GAM2084 RNA is designated SEQ ID:4672, and is provided hereinbelow with reference to the sequence listing part.

[29051] GAM2084 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2084 target RNA, herein designated GAM TARGET RNA. GAM2084 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[29052] GAM2084 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2084 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2084 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2084 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2084 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[29053] The complementary binding of GAM2084 RNA, herein designated GAM RNA, to target binding sites on GAM2084 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2084 target RNA, herein designated GAM TARGET RNA, into GAM2084 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[29054] It is appreciated that GAM2084 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2084 target genes. The

mRNA of each one of this plurality of GAM2084 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2084 RNA, herein designated GAM RNA, and which when bound by GAM2084 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2084 target proteins.

[29055] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2084 gene, herein designated GAM GENE, on one or more GAM2084 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[29056] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2084 correlate with, and may be deduced from, the identity of the target genes which GAM2084 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[29057] Nucleotide sequences of the GAM2084 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2084 RNA, herein

designated GAM RNA, and a schematic representation of the secondary folding of GAM2084 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2084 are further described hereinbelow with reference to Table 1.

[29058] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2084 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[29059] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2085 (GAM2085) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[29060] GAM2085 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2085 was detected is described hereinabove with reference to Figs. 2-8.

[29061] GAM2085 gene, herein designated GAM GENE, and GAM2085 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[29062] GAM2085 gene, herein designated GAM GENE, encodes a GAM2085 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2085 precursor RNA,

herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2085 precursor RNA is designated SEQ ID:2062, and is provided hereinbelow with reference to the sequence listing part.

[29063] GAM2085 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2085 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[29064] An enzyme complex designated DICER COMPLEX, dices the GAM2085 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2085 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM2085 RNA is designated SEQ ID:4673, and is provided hereinbelow with reference to the sequence listing part.

[29065] GAM2085 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2085 target RNA, herein designated GAM TARGET RNA. GAM2085 target RNA, herein designated GAM

TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[29066] GAM2085 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2085 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2085 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2085 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2085 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[29067] The complementary binding of GAM2085 RNA, herein designated GAM RNA, to target binding sites on GAM2085 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2085 target RNA, herein designated GAM TARGET RNA, into GAM2085 target protein, herein

designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[29068] It is appreciated that GAM2085 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2085 target genes. The mRNA of each one of this plurality of GAM2085 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2085 RNA, herein designated GAM RNA, and which when bound by GAM2085 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2085 target proteins.

[29069] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2085 gene, herein designated GAM GENE, on one or more GAM2085 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[29070] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2085 correlate with, and may be deduced from, the identity of the target

genes which GAM2085 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[29071] Nucleotide sequences of the GAM2085 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2085 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2085 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2085 are further described hereinbelow with reference to Table 1.

[29072] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2085 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[29073] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2086 (GAM2086) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[29074] GAM2086 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2086 was detected is described hereinabove with reference to Figs. 2-8.

[29075] GAM2086 gene, herein designated GAM GENE, and GAM2086 target gene, herein designated GAM TARGET GENE, are human genes contained in the

human genome.

[29076] GAM2086 gene, herein designated GAM GENE, encodes a GAM2086 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2086 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2086 precursor RNA is designated SEQ ID:2063, and is provided hereinbelow with reference to the sequence listing part.

[29077] GAM2086 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2086 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[29078] An enzyme complex designated DICER COMPLEX, dices the GAM2086 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2086 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 81%) nucleotide sequence of GAM2086 RNA is designated SEQ ID:4674, and is provided

hereinbelow with reference to the sequence listing part.

[29079] GAM2086 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2086 target RNA, herein designated GAM TARGET RNA. GAM2086 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[29080] GAM2086 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2086 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2086 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2086 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2086 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[29081] The complementary binding of GAM2086 RNA, herein designated GAM RNA, to target binding sites on GAM2086 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2086 target RNA, herein designated GAM TARGET RNA, into GAM2086 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[29082] It is appreciated that GAM2086 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2086 target genes. The mRNA of each one of this plurality of GAM2086 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2086 RNA, herein designated GAM RNA, and which when bound by GAM2086 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2086 target proteins.

[29083] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2086 gene, herein designated GAM GENE, on one or more GAM2086 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding

sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[29084] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2086 correlate with, and may be deduced from, the identity of the target genes which GAM2086 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[29085] Nucleotide sequences of the GAM2086 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2086 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2086 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2086 are further described hereinbelow with reference to Table 1.

[29086] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2086 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[29087] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2087 (GAM2087) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[29088] GAM2087 is a novel bioinformatically detected regulatory, non protein

coding, micro RNA (miRNA) gene. The method by which GAM2087 was detected is described hereinabove with reference to Figs. 2-8.

[29089] GAM2087 gene, herein designated GAM GENE, and GAM2087 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[29090] GAM2087 gene, herein designated GAM GENE, encodes a GAM2087 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2087 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2087 precursor RNA is designated SEQ ID:2064, and is provided hereinbelow with reference to the sequence listing part.

[29091] GAM2087 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2087 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[29092] An enzyme complex designated DICER COMPLEX, dices the GAM2087 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2087 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin

structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 83%) nucleotide sequence of GAM2087 RNA is designated SEQ ID:4675, and is provided hereinbelow with reference to the sequence listing part.

[29093] GAM2087 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2087 target RNA, herein designated GAM TARGET RNA. GAM2087 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[29094] GAM2087 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2087 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2087 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2087 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2087 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target

binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[29095] The complementary binding of GAM2087 RNA, herein designated GAM RNA, to target binding sites on GAM2087 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2087 target RNA, herein designated GAM TARGET RNA, into GAM2087 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[29096] It is appreciated that GAM2087 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2087 target genes. The mRNA of each one of this plurality of GAM2087 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2087 RNA, herein designated GAM RNA, and which when bound by GAM2087 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2087 target proteins.

[29097] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2087 gene, herein designated GAM GENE, on one or more GAM2087 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary

binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[29098] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2087 correlate with, and may be deduced from, the identity of the target genes which GAM2087 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[29099] Nucleotide sequences of the GAM2087 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2087 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2087 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2087 are further described hereinbelow with reference to Table 1.

[29100] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2087 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[29101] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2088 (GAM2088) gene, which modulates

expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[29102] GAM2088 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2088 was detected is described hereinabove with reference to Figs. 2-8.

[29103] GAM2088 gene, herein designated GAM GENE, and GAM2088 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[29104] GAM2088 gene, herein designated GAM GENE, encodes a GAM2088 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2088 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2088 precursor RNA is designated SEQ ID:2065, and is provided hereinbelow with reference to the sequence listing part.

[29105] GAM2088 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2088 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[29106] An enzyme complex designated DICER COMPLEX, dices the GAM2088 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2088 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 83%) nucleotide sequence of GAM2088 RNA is designated SEQ ID:4677, and is provided hereinbelow with reference to the sequence listing part.

[29107] GAM2088 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2088 target RNA, herein designated GAM TARGET RNA. GAM2088 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[29108] GAM2088 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2088 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2088 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an

illustration only, and is not meant to be limiting GAM2088 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2088 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[29109] The complementary binding of GAM2088 RNA, herein designated GAM RNA, to target binding sites on GAM2088 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2088 target RNA, herein designated GAM TARGET RNA, into GAM2088 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[29110] It is appreciated that GAM2088 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2088 target genes. The mRNA of each one of this plurality of GAM2088 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2088 RNA, herein designated GAM RNA, and which when bound by GAM2088 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2088 target proteins.

[29111] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition

exerted by GAM2088 gene, herein designated GAM GENE, on one or more GAM2088 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[29112] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2088 correlate with, and may be deduced from, the identity of the target genes which GAM2088 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[29113] Nucleotide sequences of the GAM2088 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2088 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2088 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2088 are further described hereinbelow with reference to Table 1.

[29114] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2088 RNA, herein designated GAM RNA, are described hereinbelow

with reference to Table 2.

[29115] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2089 (GAM2089) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[29116] GAM2089 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2089 was detected is described hereinabove with reference to Figs. 2-8.

[29117] GAM2089 gene, herein designated GAM GENE, and GAM2089 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[29118] GAM2089 gene, herein designated GAM GENE, encodes a GAM2089 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2089 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2089 precursor RNA is designated SEQ ID:2066, and is provided hereinbelow with reference to the sequence listing part.

[29119] GAM2089 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2089 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA

encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[29120] An enzyme complex designated DICER COMPLEX, dices the GAM2089 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2089 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 85%) nucleotide sequence of GAM2089 RNA is designated SEQ ID:4676, and is provided hereinbelow with reference to the sequence listing part.

[29121] GAM2089 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2089 target RNA, herein designated GAM TARGET RNA. GAM2089 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[29122] GAM2089 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2089 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2089 RNA,

herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2089 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2089 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[29123] The complementary binding of GAM2089 RNA, herein designated GAM RNA, to target binding sites on GAM2089 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2089 target RNA, herein designated GAM TARGET RNA, into GAM2089 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[29124] It is appreciated that GAM2089 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2089 target genes. The mRNA of each one of this plurality of GAM2089 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2089 RNA, herein designated GAM RNA, and which when bound by GAM2089 RNA, herein designated GAM RNA,

causes inhibition of translation of respective one or more GAM2089 target proteins.

[29125] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2089 gene, herein designated GAM GENE, on one or more GAM2089 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[29126] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2089 correlate with, and may be deduced from, the identity of the target genes which GAM2089 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[29127] Nucleotide sequences of the GAM2089 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2089 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2089 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2089 are further described hereinbelow with reference to Table 1.

[29128] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2089 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[29129] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2090 (GAM2090) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[29130] GAM2090 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2090 was detected is described hereinabove with reference to Figs. 2-8.

[29131] GAM2090 gene, herein designated GAM GENE, and GAM2090 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[29132] GAM2090 gene, herein designated GAM GENE, encodes a GAM2090 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2090 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2090 precursor RNA is designated SEQ ID:2067, and is provided hereinbelow with reference to the sequence listing part.

[29133] GAM2090 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2090 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[29134] An enzyme complex designated DICER COMPLEX, dices the GAM2090 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2090 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 88%) nucleotide sequence of GAM2090 RNA is designated SEQ ID:4678, and is provided hereinbelow with reference to the sequence listing part.

[29135] GAM2090 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2090 target RNA, herein designated GAM TARGET RNA. GAM2090 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[29136] GAM2090 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2090 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2090 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2090 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2090 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[29137] The complementary binding of GAM2090 RNA, herein designated GAM RNA, to target binding sites on GAM2090 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2090 target RNA, herein designated GAM TARGET RNA, into GAM2090 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[29138] It is appreciated that GAM2090 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2090 target genes. The

mRNA of each one of this plurality of GAM2090 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2090 RNA, herein designated GAM RNA, and which when bound by GAM2090 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2090 target proteins.

[29139] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2090 gene, herein designated GAM GENE, on one or more GAM2090 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[29140] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2090 correlate with, and may be deduced from, the identity of the target genes which GAM2090 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[29141] Nucleotide sequences of the GAM2090 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2090 RNA, herein

designated GAM RNA, and a schematic representation of the secondary folding of GAM2090 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2090 are further described hereinbelow with reference to Table 1.

[29142] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2090 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[29143] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2091 (GAM2091) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[29144] GAM2091 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2091 was detected is described hereinabove with reference to Figs. 2-8.

[29145] GAM2091 gene, herein designated GAM GENE, and GAM2091 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[29146] GAM2091 gene, herein designated GAM GENE, encodes a GAM2091 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2091 precursor RNA,

herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2091 precursor RNA is designated SEQ ID:2068, and is provided hereinbelow with reference to the sequence listing part.

[29147] GAM2091 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2091 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[29148] An enzyme complex designated DICER COMPLEX, dices the GAM2091 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2091 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 88%) nucleotide sequence of GAM2091 RNA is designated SEQ ID:4679, and is provided hereinbelow with reference to the sequence listing part.

[29149] GAM2091 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2091 target RNA, herein designated GAM TARGET RNA. GAM2091 target RNA, herein designated GAM

TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[29150] GAM2091 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2091 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2091 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2091 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2091 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[29151] The complementary binding of GAM2091 RNA, herein designated GAM RNA, to target binding sites on GAM2091 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2091 target RNA, herein designated GAM TARGET RNA, into GAM2091 target protein, herein

designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[29152] It is appreciated that GAM2091 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2091 target genes. The mRNA of each one of this plurality of GAM2091 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2091 RNA, herein designated GAM RNA, and which when bound by GAM2091 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2091 target proteins.

[29153] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2091 gene, herein designated GAM GENE, on one or more GAM2091 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[29154] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2091 correlate with, and may be deduced from, the identity of the target

genes which GAM2091 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[29155] Nucleotide sequences of the GAM2091 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2091 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2091 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2091 are further described hereinbelow with reference to Table 1.

[29156] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2091 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[29157] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2092 (GAM2092) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[29158] GAM2092 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2092 was detected is described hereinabove with reference to Figs. 2-8.

[29159] GAM2092 gene, herein designated GAM GENE, and GAM2092 target gene, herein designated GAM TARGET GENE, are human genes contained in the

human genome.

[29160] GAM2092 gene, herein designated GAM GENE, encodes a GAM2092 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2092 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2092 precursor RNA is designated SEQ ID:2069, and is provided hereinbelow with reference to the sequence listing part.

[29161] GAM2092 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2092 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[29162] An enzyme complex designated DICER COMPLEX, dices the GAM2092 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2092 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 25%) nucleotide sequence of GAM2092 RNA is designated SEQ ID:4680, and is provided

hereinbelow with reference to the sequence listing part.

[29163] GAM2092 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2092 target RNA, herein designated GAM TARGET RNA. GAM2092 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[29164] GAM2092 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2092 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2092 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2092 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2092 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[29165] The complementary binding of GAM2092 RNA, herein designated GAM RNA, to target binding sites on GAM2092 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2092 target RNA, herein designated GAM TARGET RNA, into GAM2092 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[29166] It is appreciated that GAM2092 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2092 target genes. The mRNA of each one of this plurality of GAM2092 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2092 RNA, herein designated GAM RNA, and which when bound by GAM2092 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2092 target proteins.

[29167] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2092 gene, herein designated GAM GENE, on one or more GAM2092 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding

sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[29168] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2092 correlate with, and may be deduced from, the identity of the target genes which GAM2092 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[29169] Nucleotide sequences of the GAM2092 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2092 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2092 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2092 are further described hereinbelow with reference to Table 1.

[29170] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2092 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[29171] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2093 (GAM2093) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[29172] GAM2093 is a novel bioinformatically detected regulatory, non protein

coding, micro RNA (miRNA) gene. The method by which GAM2093 was detected is described hereinabove with reference to Figs. 2-8.

[29173] GAM2093 gene, herein designated GAM GENE, and GAM2093 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[29174] GAM2093 gene, herein designated GAM GENE, encodes a GAM2093 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2093 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2093 precursor RNA is designated SEQ ID:2070, and is provided hereinbelow with reference to the sequence listing part.

[29175] GAM2093 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2093 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[29176] An enzyme complex designated DICER COMPLEX, dices the GAM2093 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2093 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin

structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 82%) nucleotide sequence of GAM2093 RNA is designated SEQ ID:4681, and is provided hereinbelow with reference to the sequence listing part.

[29177] GAM2093 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2093 target RNA, herein designated GAM TARGET RNA. GAM2093 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[29178] GAM2093 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2093 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2093 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2093 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2093 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target

binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[29179] The complementary binding of GAM2093 RNA, herein designated GAM RNA, to target binding sites on GAM2093 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2093 target RNA, herein designated GAM TARGET RNA, into GAM2093 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[29180] It is appreciated that GAM2093 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2093 target genes. The mRNA of each one of this plurality of GAM2093 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2093 RNA, herein designated GAM RNA, and which when bound by GAM2093 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2093 target proteins.

[29181] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2093 gene, herein designated GAM GENE, on one or more GAM2093 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary

binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[29182] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2093 correlate with, and may be deduced from, the identity of the target genes which GAM2093 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[29183] Nucleotide sequences of the GAM2093 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2093 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2093 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2093 are further described hereinbelow with reference to Table 1.

[29184] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2093 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[29185] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2094 (GAM2094) gene, which modulates

expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[29186] GAM2094 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2094 was detected is described hereinabove with reference to Figs. 2-8.

[29187] GAM2094 gene, herein designated GAM GENE, and GAM2094 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[29188] GAM2094 gene, herein designated GAM GENE, encodes a GAM2094 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2094 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2094 precursor RNA is designated SEQ ID:2071, and is provided hereinbelow with reference to the sequence listing part.

[29189] GAM2094 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2094 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[29190] An enzyme complex designated DICER COMPLEX, dices the GAM2094 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2094 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM2094 RNA is designated SEQ ID:4682, and is provided hereinbelow with reference to the sequence listing part.

[29191] GAM2094 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2094 target RNA, herein designated GAM TARGET RNA. GAM2094 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[29192] GAM2094 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2094 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2094 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an

illustration only, and is not meant to be limiting GAM2094 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2094 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[29193] The complementary binding of GAM2094 RNA, herein designated GAM RNA, to target binding sites on GAM2094 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2094 target RNA, herein designated GAM TARGET RNA, into GAM2094 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[29194] It is appreciated that GAM2094 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2094 target genes. The mRNA of each one of this plurality of GAM2094 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2094 RNA, herein designated GAM RNA, and which when bound by GAM2094 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2094 target proteins.

[29195] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition

exerted by GAM2094 gene, herein designated GAM GENE, on one or more GAM2094 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[29196] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2094 correlate with, and may be deduced from, the identity of the target genes which GAM2094 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[29197] Nucleotide sequences of the GAM2094 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2094 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2094 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2094 are further described hereinbelow with reference to Table 1.

[29198] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2094 RNA, herein designated GAM RNA, are described hereinbelow

with reference to Table 2.

[29199] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2095 (GAM2095) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[29200] GAM2095 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2095 was detected is described hereinabove with reference to Figs. 2-8.

[29201] GAM2095 gene, herein designated GAM GENE, and GAM2095 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[29202] GAM2095 gene, herein designated GAM GENE, encodes a GAM2095 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2095 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2095 precursor RNA is designated SEQ ID:2072, and is provided hereinbelow with reference to the sequence listing part.

[29203] GAM2095 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2095 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA

encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[29204] An enzyme complex designated DICER COMPLEX, dices the GAM2095 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2095 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 81%) nucleotide sequence of GAM2095 RNA is designated SEQ ID:4685, and is provided hereinbelow with reference to the sequence listing part.

[29205] GAM2095 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2095 target RNA, herein designated GAM TARGET RNA. GAM2095 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[29206] GAM2095 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2095 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2095 RNA,

herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2095 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2095 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[29207] The complementary binding of GAM2095 RNA, herein designated GAM RNA, to target binding sites on GAM2095 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2095 target RNA, herein designated GAM TARGET RNA, into GAM2095 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[29208] It is appreciated that GAM2095 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2095 target genes. The mRNA of each one of this plurality of GAM2095 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2095 RNA, herein designated GAM RNA, and which when bound by GAM2095 RNA, herein designated GAM RNA,

causes inhibition of translation of respective one or more GAM2095 target proteins.

[29209] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2095 gene, herein designated GAM GENE, on one or more GAM2095 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[29210] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2095 correlate with, and may be deduced from, the identity of the target genes which GAM2095 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[29211] Nucleotide sequences of the GAM2095 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2095 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2095 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2095 are further described hereinbelow with reference to Table 1.

[29212] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2095 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[29213] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2096 (GAM2096) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[29214] GAM2096 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2096 was detected is described hereinabove with reference to Figs. 2-8.

[29215] GAM2096 gene, herein designated GAM GENE, and GAM2096 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[29216] GAM2096 gene, herein designated GAM GENE, encodes a GAM2096 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2096 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2096 precursor RNA is designated SEQ ID:2073, and is provided hereinbelow with reference to the sequence listing part.

[29217] GAM2096 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2096 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[29218] An enzyme complex designated DICER COMPLEX, dices the GAM2096 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2096 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 86%) nucleotide sequence of GAM2096 RNA is designated SEQ ID:4684, and is provided hereinbelow with reference to the sequence listing part.

[29219] GAM2096 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2096 target RNA, herein designated GAM TARGET RNA. GAM2096 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[29220] GAM2096 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2096 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2096 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2096 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2096 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[29221] The complementary binding of GAM2096 RNA, herein designated GAM RNA, to target binding sites on GAM2096 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2096 target RNA, herein designated GAM TARGET RNA, into GAM2096 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[29222] It is appreciated that GAM2096 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2096 target genes. The

mRNA of each one of this plurality of GAM2096 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2096 RNA, herein designated GAM RNA, and which when bound by GAM2096 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2096 target proteins.

[29223] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2096 gene, herein designated GAM GENE, on one or more GAM2096 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[29224] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2096 correlate with, and may be deduced from, the identity of the target genes which GAM2096 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[29225] Nucleotide sequences of the GAM2096 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2096 RNA, herein

designated GAM RNA, and a schematic representation of the secondary folding of GAM2096 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2096 are further described hereinbelow with reference to Table 1.

[29226] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2096 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[29227] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2097 (GAM2097) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[29228] GAM2097 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2097 was detected is described hereinabove with reference to Figs. 2-8.

[29229] GAM2097 gene, herein designated GAM GENE, and GAM2097 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[29230] GAM2097 gene, herein designated GAM GENE, encodes a GAM2097 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2097 precursor RNA,

herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2097 precursor RNA is designated SEQ ID:2074, and is provided hereinbelow with reference to the sequence listing part.

[29231] GAM2097 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2097 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[29232] An enzyme complex designated DICER COMPLEX, dices the GAM2097 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2097 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 82%) nucleotide sequence of GAM2097 RNA is designated SEQ ID:4683, and is provided hereinbelow with reference to the sequence listing part.

[29233] GAM2097 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2097 target RNA, herein designated GAM TARGET RNA. GAM2097 target RNA, herein designated GAM

TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[29234] GAM2097 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2097 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2097 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2097 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2097 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[29235] The complementary binding of GAM2097 RNA, herein designated GAM RNA, to target binding sites on GAM2097 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2097 target RNA, herein designated GAM TARGET RNA, into GAM2097 target protein, herein

designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[29236] It is appreciated that GAM2097 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2097 target genes. The mRNA of each one of this plurality of GAM2097 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2097 RNA, herein designated GAM RNA, and which when bound by GAM2097 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2097 target proteins.

[29237] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2097 gene, herein designated GAM GENE, on one or more GAM2097 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[29238] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2097 correlate with, and may be deduced from, the identity of the target

genes which GAM2097 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[29239] Nucleotide sequences of the GAM2097 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2097 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2097 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2097 are further described hereinbelow with reference to Table 1.

[29240] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2097 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[29241] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2098 (GAM2098) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[29242] GAM2098 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2098 was detected is described hereinabove with reference to Figs. 2-8.

[29243] GAM2098 gene, herein designated GAM GENE, and GAM2098 target gene, herein designated GAM TARGET GENE, are human genes contained in the

human genome.

[29244] GAM2098 gene, herein designated GAM GENE, encodes a GAM2098 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2098 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2098 precursor RNA is designated SEQ ID:2075, and is provided hereinbelow with reference to the sequence listing part.

[29245] GAM2098 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2098 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[29246] An enzyme complex designated DICER COMPLEX, dices the GAM2098 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2098 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 87%) nucleotide sequence of GAM2098 RNA is designated SEQ ID:4686, and is provided

hereinbelow with reference to the sequence listing part.

[29247] GAM2098 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2098 target RNA, herein designated GAM TARGET RNA. GAM2098 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[29248] GAM2098 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2098 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2098 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2098 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2098 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[29249] The complementary binding of GAM2098 RNA, herein designated GAM RNA, to target binding sites on GAM2098 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2098 target RNA, herein designated GAM TARGET RNA, into GAM2098 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[29250] It is appreciated that GAM2098 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2098 target genes. The mRNA of each one of this plurality of GAM2098 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2098 RNA, herein designated GAM RNA, and which when bound by GAM2098 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2098 target proteins.

[29251] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2098 gene, herein designated GAM GENE, on one or more GAM2098 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding

sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[29252] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2098 correlate with, and may be deduced from, the identity of the target genes which GAM2098 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[29253] Nucleotide sequences of the GAM2098 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2098 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2098 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2098 are further described hereinbelow with reference to Table 1.

[29254] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2098 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[29255] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2099 (GAM2099) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[29256] GAM2099 is a novel bioinformatically detected regulatory, non protein

coding, micro RNA (miRNA) gene. The method by which GAM2099 was detected is described hereinabove with reference to Figs. 2-8.

[29257] GAM2099 gene, herein designated GAM GENE, and GAM2099 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[29258] GAM2099 gene, herein designated GAM GENE, encodes a GAM2099 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2099 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2099 precursor RNA is designated SEQ ID:2076, and is provided hereinbelow with reference to the sequence listing part.

[29259] GAM2099 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2099 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[29260] An enzyme complex designated DICER COMPLEX, dices the GAM2099 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2099 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin

structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 83%) nucleotide sequence of GAM2099 RNA is designated SEQ ID:4687, and is provided hereinbelow with reference to the sequence listing part.

[29261] GAM2099 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2099 target RNA, herein designated GAM TARGET RNA. GAM2099 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[29262] GAM2099 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2099 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2099 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2099 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2099 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target

binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[29263] The complementary binding of GAM2099 RNA, herein designated GAM RNA, to target binding sites on GAM2099 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2099 target RNA, herein designated GAM TARGET RNA, into GAM2099 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[29264] It is appreciated that GAM2099 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2099 target genes. The mRNA of each one of this plurality of GAM2099 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2099 RNA, herein designated GAM RNA, and which when bound by GAM2099 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2099 target proteins.

[29265] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2099 gene, herein designated GAM GENE, on one or more GAM2099 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary

binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[29266] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2099 correlate with, and may be deduced from, the identity of the target genes which GAM2099 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[29267] Nucleotide sequences of the GAM2099 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2099 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2099 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2099 are further described hereinbelow with reference to Table 1.

[29268] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2099 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[29269] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2100 (GAM2100) gene, which modulates

expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[29270] GAM2100 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2100 was detected is described hereinabove with reference to Figs. 2-8.

[29271] GAM2100 gene, herein designated GAM GENE, and GAM2100 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[29272] GAM2100 gene, herein designated GAM GENE, encodes a GAM2100 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2100 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2100 precursor RNA is designated SEQ ID:2077, and is provided hereinbelow with reference to the sequence listing part.

[29273] GAM2100 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2100 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[29274] An enzyme complex designated DICER COMPLEX, dices the GAM2100 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2100 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 79%) nucleotide sequence of GAM2100 RNA is designated SEQ ID:4688, and is provided hereinbelow with reference to the sequence listing part.

[29275] GAM2100 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2100 target RNA, herein designated GAM TARGET RNA. GAM2100 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[29276] GAM2100 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2100 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2100 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an

illustration only, and is not meant to be limiting GAM2100 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2100 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[29277] The complementary binding of GAM2100 RNA, herein designated GAM RNA, to target binding sites on GAM2100 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2100 target RNA, herein designated GAM TARGET RNA, into GAM2100 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[29278] It is appreciated that GAM2100 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2100 target genes. The mRNA of each one of this plurality of GAM2100 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2100 RNA, herein designated GAM RNA, and which when bound by GAM2100 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2100 target proteins.

[29279] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition

exerted by GAM2100 gene, herein designated GAM GENE, on one or more GAM2100 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[29280] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2100 correlate with, and may be deduced from, the identity of the target genes which GAM2100 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[29281] Nucleotide sequences of the GAM2100 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2100 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2100 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2100 are further described hereinbelow with reference to Table 1.

[29282] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2100 RNA, herein designated GAM RNA, are described hereinbelow

with reference to Table 2.

[29283] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2101 (GAM2101) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[29284] GAM2101 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2101 was detected is described hereinabove with reference to Figs. 2-8.

[29285] GAM2101 gene, herein designated GAM GENE, and GAM2101 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[29286] GAM2101 gene, herein designated GAM GENE, encodes a GAM2101 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2101 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2101 precursor RNA is designated SEQ ID:2078, and is provided hereinbelow with reference to the sequence listing part.

[29287] GAM2101 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2101 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA

encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[29288] An enzyme complex designated DICER COMPLEX, dices the GAM2101 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2101 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM2101 RNA is designated SEQ ID:4689, and is provided hereinbelow with reference to the sequence listing part.

[29289] GAM2101 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2101 target RNA, herein designated GAM TARGET RNA. GAM2101 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[29290] GAM2101 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2101 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2101 RNA,

herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2101 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2101 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[29291] The complementary binding of GAM2101 RNA, herein designated GAM RNA, to target binding sites on GAM2101 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2101 target RNA, herein designated GAM TARGET RNA, into GAM2101 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[29292] It is appreciated that GAM2101 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2101 target genes. The mRNA of each one of this plurality of GAM2101 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2101 RNA, herein designated GAM RNA, and which when bound by GAM2101 RNA, herein designated GAM RNA,

causes inhibition of translation of respective one or more GAM2101 target proteins.

[29293] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2101 gene, herein designated GAM GENE, on one or more GAM2101 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[29294] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2101 correlate with, and may be deduced from, the identity of the target genes which GAM2101 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[29295] Nucleotide sequences of the GAM2101 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2101 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2101 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2101 are further described hereinbelow with reference to Table 1.

[29296] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2101 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[29297] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2102 (GAM2102) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[29298] GAM2102 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2102 was detected is described hereinabove with reference to Figs. 2-8.

[29299] GAM2102 gene, herein designated GAM GENE, and GAM2102 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[29300] GAM2102 gene, herein designated GAM GENE, encodes a GAM2102 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2102 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2102 precursor RNA is designated SEQ ID:2079, and is provided hereinbelow with reference to the sequence listing part.

[29301] GAM2102 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2102 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[29302] An enzyme complex designated DICER COMPLEX, dices the GAM2102 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2102 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 88%) nucleotide sequence of GAM2102 RNA is designated SEQ ID:4690, and is provided hereinbelow with reference to the sequence listing part.

[29303] GAM2102 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2102 target RNA, herein designated GAM TARGET RNA. GAM2102 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[29304] GAM2102 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2102 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2102 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2102 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2102 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[29305] The complementary binding of GAM2102 RNA, herein designated GAM RNA, to target binding sites on GAM2102 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2102 target RNA, herein designated GAM TARGET RNA, into GAM2102 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[29306] It is appreciated that GAM2102 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2102 target genes. The

mRNA of each one of this plurality of GAM2102 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2102 RNA, herein designated GAM RNA, and which when bound by GAM2102 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2102 target proteins.

[29307] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2102 gene, herein designated GAM GENE, on one or more GAM2102 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[29308] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2102 correlate with, and may be deduced from, the identity of the target genes which GAM2102 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[29309] Nucleotide sequences of the GAM2102 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2102 RNA, herein

designated GAM RNA, and a schematic representation of the secondary folding of GAM2102 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2102 are further described hereinbelow with reference to Table 1.

[29310] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2102 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[29311] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2103 (GAM2103) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[29312] GAM2103 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2103 was detected is described hereinabove with reference to Figs. 2-8.

[29313] GAM2103 gene, herein designated GAM GENE, and GAM2103 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[29314] GAM2103 gene, herein designated GAM GENE, encodes a GAM2103 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2103 precursor RNA,

herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2103 precursor RNA is designated SEQ ID:2080, and is provided hereinbelow with reference to the sequence listing part.

[29315] GAM2103 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2103 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[29316] An enzyme complex designated DICER COMPLEX, dices the GAM2103 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2103 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 83%) nucleotide sequence of GAM2103 RNA is designated SEQ ID:4691, and is provided hereinbelow with reference to the sequence listing part.

[29317] GAM2103 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2103 target RNA, herein designated GAM TARGET RNA. GAM2103 target RNA, herein designated GAM

TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[29318] GAM2103 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2103 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2103 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2103 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2103 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[29319] The complementary binding of GAM2103 RNA, herein designated GAM RNA, to target binding sites on GAM2103 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2103 target RNA, herein designated GAM TARGET RNA, into GAM2103 target protein, herein

designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[29320] It is appreciated that GAM2103 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2103 target genes. The mRNA of each one of this plurality of GAM2103 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2103 RNA, herein designated GAM RNA, and which when bound by GAM2103 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2103 target proteins.

[29321] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2103 gene, herein designated GAM GENE, on one or more GAM2103 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[29322] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2103 correlate with, and may be deduced from, the identity of the target

genes which GAM2103 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[29323] Nucleotide sequences of the GAM2103 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2103 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2103 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2103 are further described hereinbelow with reference to Table 1.

[29324] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2103 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[29325] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2104 (GAM2104) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[29326] GAM2104 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2104 was detected is described hereinabove with reference to Figs. 2-8.

[29327] GAM2104 gene, herein designated GAM GENE, and GAM2104 target gene, herein designated GAM TARGET GENE, are human genes contained in the

human genome.

[29328] GAM2104 gene, herein designated GAM GENE, encodes a GAM2104 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2104 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2104 precursor RNA is designated SEQ ID:2081, and is provided hereinbelow with reference to the sequence listing part.

[29329] GAM2104 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2104 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[29330] An enzyme complex designated DICER COMPLEX, dices the GAM2104 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2104 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 76%) nucleotide sequence of GAM2104 RNA is designated SEQ ID:4692, and is provided

hereinbelow with reference to the sequence listing part.

[29331] GAM2104 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2104 target RNA, herein designated GAM TARGET RNA. GAM2104 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[29332] GAM2104 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2104 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2104 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2104 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2104 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[29333] The complementary binding of GAM2104 RNA, herein designated GAM RNA, to target binding sites on GAM2104 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2104 target RNA, herein designated GAM TARGET RNA, into GAM2104 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[29334] It is appreciated that GAM2104 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2104 target genes. The mRNA of each one of this plurality of GAM2104 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2104 RNA, herein designated GAM RNA, and which when bound by GAM2104 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2104 target proteins.

[29335] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2104 gene, herein designated GAM GENE, on one or more GAM2104 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding

sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[29336] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2104 correlate with, and may be deduced from, the identity of the target genes which GAM2104 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[29337] Nucleotide sequences of the GAM2104 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2104 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2104 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2104 are further described hereinbelow with reference to Table 1.

[29338] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2104 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[29339] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2105 (GAM2105) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[29340] GAM2105 is a novel bioinformatically detected regulatory, non protein

coding, micro RNA (miRNA) gene. The method by which GAM2105 was detected is described hereinabove with reference to Figs. 2-8.

[29341] GAM2105 gene, herein designated GAM GENE, and GAM2105 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[29342] GAM2105 gene, herein designated GAM GENE, encodes a GAM2105 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2105 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2105 precursor RNA is designated SEQ ID:2082, and is provided hereinbelow with reference to the sequence listing part.

[29343] GAM2105 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2105 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[29344] An enzyme complex designated DICER COMPLEX, dices the GAM2105 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2105 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin

structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM2105 RNA is designated SEQ ID:4693, and is provided hereinbelow with reference to the sequence listing part.

[29345] GAM2105 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2105 target RNA, herein designated GAM TARGET RNA. GAM2105 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[29346] GAM2105 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2105 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2105 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2105 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2105 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target

binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[29347] The complementary binding of GAM2105 RNA, herein designated GAM RNA, to target binding sites on GAM2105 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2105 target RNA, herein designated GAM TARGET RNA, into GAM2105 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[29348] It is appreciated that GAM2105 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2105 target genes. The mRNA of each one of this plurality of GAM2105 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2105 RNA, herein designated GAM RNA, and which when bound by GAM2105 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2105 target proteins.

[29349] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2105 gene, herein designated GAM GENE, on one or more GAM2105 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary

binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[29350] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2105 correlate with, and may be deduced from, the identity of the target genes which GAM2105 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[29351] Nucleotide sequences of the GAM2105 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2105 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2105 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2105 are further described hereinbelow with reference to Table 1.

[29352] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2105 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[29353] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2106 (GAM2106) gene, which modulates

expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[29354] GAM2106 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2106 was detected is described hereinabove with reference to Figs. 2-8.

[29355] GAM2106 gene, herein designated GAM GENE, and GAM2106 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[29356] GAM2106 gene, herein designated GAM GENE, encodes a GAM2106 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2106 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2106 precursor RNA is designated SEQ ID:2083, and is provided hereinbelow with reference to the sequence listing part.

[29357] GAM2106 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2106 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[29358] An enzyme complex designated DICER COMPLEX, dices the GAM2106 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2106 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM2106 RNA is designated SEQ ID:4694, and is provided hereinbelow with reference to the sequence listing part.

[29359] GAM2106 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2106 target RNA, herein designated GAM TARGET RNA. GAM2106 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[29360] GAM2106 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2106 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2106 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an

illustration only, and is not meant to be limiting GAM2106 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2106 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[29361] The complementary binding of GAM2106 RNA, herein designated GAM RNA, to target binding sites on GAM2106 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2106 target RNA, herein designated GAM TARGET RNA, into GAM2106 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[29362] It is appreciated that GAM2106 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2106 target genes. The mRNA of each one of this plurality of GAM2106 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2106 RNA, herein designated GAM RNA, and which when bound by GAM2106 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2106 target proteins.

[29363] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition

exerted by GAM2106 gene, herein designated GAM GENE, on one or more GAM2106 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[29364] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2106 correlate with, and may be deduced from, the identity of the target genes which GAM2106 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[29365] Nucleotide sequences of the GAM2106 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2106 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2106 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2106 are further described hereinbelow with reference to Table 1.

[29366] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2106 RNA, herein designated GAM RNA, are described hereinbelow

with reference to Table 2.

[29367] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2107 (GAM2107) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[29368] GAM2107 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2107 was detected is described hereinabove with reference to Figs. 2-8.

[29369] GAM2107 gene, herein designated GAM GENE, and GAM2107 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[29370] GAM2107 gene, herein designated GAM GENE, encodes a GAM2107 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2107 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2107 precursor RNA is designated SEQ ID:2084, and is provided hereinbelow with reference to the sequence listing part.

[29371] GAM2107 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2107 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA

encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[29372] An enzyme complex designated DICER COMPLEX, dices the GAM2107 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2107 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 80%) nucleotide sequence of GAM2107 RNA is designated SEQ ID:4695, and is provided hereinbelow with reference to the sequence listing part.

[29373] GAM2107 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2107 target RNA, herein designated GAM TARGET RNA. GAM2107 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[29374] GAM2107 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2107 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2107 RNA,

herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2107 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2107 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[29375] The complementary binding of GAM2107 RNA, herein designated GAM RNA, to target binding sites on GAM2107 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2107 target RNA, herein designated GAM TARGET RNA, into GAM2107 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[29376] It is appreciated that GAM2107 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2107 target genes. The mRNA of each one of this plurality of GAM2107 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2107 RNA, herein designated GAM RNA, and which when bound by GAM2107 RNA, herein designated GAM RNA,

causes inhibition of translation of respective one or more GAM2107 target proteins.

[29377] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2107 gene, herein designated GAM GENE, on one or more GAM2107 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[29378] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2107 correlate with, and may be deduced from, the identity of the target genes which GAM2107 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[29379] Nucleotide sequences of the GAM2107 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2107 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2107 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2107 are further described hereinbelow with reference to Table 1.

[29380] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2107 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[29381] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2108 (GAM2108) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[29382] GAM2108 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2108 was detected is described hereinabove with reference to Figs. 2-8.

[29383] GAM2108 gene, herein designated GAM GENE, and GAM2108 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[29384] GAM2108 gene, herein designated GAM GENE, encodes a GAM2108 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2108 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2108 precursor RNA is designated SEQ ID:2085, and is provided hereinbelow with reference to the sequence listing part.

[29385] GAM2108 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2108 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[29386] An enzyme complex designated DICER COMPLEX, dices the GAM2108 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2108 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 79%) nucleotide sequence of GAM2108 RNA is designated SEQ ID:4696, and is provided hereinbelow with reference to the sequence listing part.

[29387] GAM2108 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2108 target RNA, herein designated GAM TARGET RNA. GAM2108 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[29388] GAM2108 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2108 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2108 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2108 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2108 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[29389] The complementary binding of GAM2108 RNA, herein designated GAM RNA, to target binding sites on GAM2108 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2108 target RNA, herein designated GAM TARGET RNA, into GAM2108 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[29390] It is appreciated that GAM2108 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2108 target genes. The

mRNA of each one of this plurality of GAM2108 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2108 RNA, herein designated GAM RNA, and which when bound by GAM2108 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2108 target proteins.

[29391] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2108 gene, herein designated GAM GENE, on one or more GAM2108 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[29392] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2108 correlate with, and may be deduced from, the identity of the target genes which GAM2108 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[29393] Nucleotide sequences of the GAM2108 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2108 RNA, herein

designated GAM RNA, and a schematic representation of the secondary folding of GAM2108 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2108 are further described hereinbelow with reference to Table 1.

[29394] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2108 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[29395] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2109 (GAM2109) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[29396] GAM2109 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2109 was detected is described hereinabove with reference to Figs. 2-8.

[29397] GAM2109 gene, herein designated GAM GENE, and GAM2109 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[29398] GAM2109 gene, herein designated GAM GENE, encodes a GAM2109 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2109 precursor RNA,

herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2109 precursor RNA is designated SEQ ID:2086, and is provided hereinbelow with reference to the sequence listing part.

[29399] GAM2109 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2109 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[29400] An enzyme complex designated DICER COMPLEX, dices the GAM2109 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2109 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM2109 RNA is designated SEQ ID:4697, and is provided hereinbelow with reference to the sequence listing part.

[29401] GAM2109 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2109 target RNA, herein designated GAM TARGET RNA. GAM2109 target RNA, herein designated GAM

TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[29402] GAM2109 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2109 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2109 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2109 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2109 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[29403] The complementary binding of GAM2109 RNA, herein designated GAM RNA, to target binding sites on GAM2109 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2109 target RNA, herein designated GAM TARGET RNA, into GAM2109 target protein, herein

designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[29404] It is appreciated that GAM2109 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2109 target genes. The mRNA of each one of this plurality of GAM2109 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2109 RNA, herein designated GAM RNA, and which when bound by GAM2109 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2109 target proteins.

[29405] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2109 gene, herein designated GAM GENE, on one or more GAM2109 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[29406] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2109 correlate with, and may be deduced from, the identity of the target

genes which GAM2109 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[29407] Nucleotide sequences of the GAM2109 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2109 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2109 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2109 are further described hereinbelow with reference to Table 1.

[29408] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2109 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[29409] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2110 (GAM2110) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[29410] GAM2110 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2110 was detected is described hereinabove with reference to Figs. 2-8.

[29411] GAM2110 gene, herein designated GAM GENE, and GAM2110 target gene, herein designated GAM TARGET GENE, are human genes contained in the

human genome.

[29412] GAM2110 gene, herein designated GAM GENE, encodes a GAM2110 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2110 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2110 precursor RNA is designated SEQ ID:2087, and is provided hereinbelow with reference to the sequence listing part.

[29413] GAM2110 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2110 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[29414] An enzyme complex designated DICER COMPLEX, dices the GAM2110 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2110 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 78%) nucleotide sequence of GAM2110 RNA is designated SEQ ID:4698, and is provided

hereinbelow with reference to the sequence listing part.

[29415] GAM2110 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2110 target RNA, herein designated GAM TARGET RNA. GAM2110 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[29416] GAM2110 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2110 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2110 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2110 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2110 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[29417] The complementary binding of GAM2110 RNA, herein designated GAM RNA, to target binding sites on GAM2110 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2110 target RNA, herein designated GAM TARGET RNA, into GAM2110 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[29418] It is appreciated that GAM2110 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2110 target genes. The mRNA of each one of this plurality of GAM2110 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2110 RNA, herein designated GAM RNA, and which when bound by GAM2110 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2110 target proteins.

[29419] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2110 gene, herein designated GAM GENE, on one or more GAM2110 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding

sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[29420] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2110 correlate with, and may be deduced from, the identity of the target genes which GAM2110 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[29421] Nucleotide sequences of the GAM2110 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2110 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2110 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2110 are further described hereinbelow with reference to Table 1.

[29422] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2110 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[29423] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2111 (GAM2111) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[29424] GAM2111 is a novel bioinformatically detected regulatory, non protein

coding, micro RNA (miRNA) gene. The method by which GAM2111 was detected is described hereinabove with reference to Figs. 2-8.

[29425] GAM2111 gene, herein designated GAM GENE, and GAM2111 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[29426] GAM2111 gene, herein designated GAM GENE, encodes a GAM2111 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2111 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2111 precursor RNA is designated SEQ ID:2088, and is provided hereinbelow with reference to the sequence listing part.

[29427] GAM2111 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2111 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[29428] An enzyme complex designated DICER COMPLEX, dices the GAM2111 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2111 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin

structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 83%) nucleotide sequence of GAM2111 RNA is designated SEQ ID:4699, and is provided hereinbelow with reference to the sequence listing part.

[29429] GAM2111 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2111 target RNA, herein designated GAM TARGET RNA. GAM2111 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[29430] GAM2111 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2111 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2111 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2111 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2111 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target

binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[29431] The complementary binding of GAM2111 RNA, herein designated GAM RNA, to target binding sites on GAM2111 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2111 target RNA, herein designated GAM TARGET RNA, into GAM2111 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[29432] It is appreciated that GAM2111 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2111 target genes. The mRNA of each one of this plurality of GAM2111 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2111 RNA, herein designated GAM RNA, and which when bound by GAM2111 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2111 target proteins.

[29433] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2111 gene, herein designated GAM GENE, on one or more GAM2111 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary

binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[29434] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2111 correlate with, and may be deduced from, the identity of the target genes which GAM2111 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[29435] Nucleotide sequences of the GAM2111 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2111 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2111 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2111 are further described hereinbelow with reference to Table 1.

[29436] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2111 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[29437] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2112 (GAM2112) gene, which modulates

expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[29438] GAM2112 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2112 was detected is described hereinabove with reference to Figs. 2-8.

[29439] GAM2112 gene, herein designated GAM GENE, and GAM2112 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[29440] GAM2112 gene, herein designated GAM GENE, encodes a GAM2112 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2112 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2112 precursor RNA is designated SEQ ID:2089, and is provided hereinbelow with reference to the sequence listing part.

[29441] GAM2112 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2112 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[29442] An enzyme complex designated DICER COMPLEX, dices the GAM2112 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2112 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 92%) nucleotide sequence of GAM2112 RNA is designated SEQ ID:4700, and is provided hereinbelow with reference to the sequence listing part.

[29443] GAM2112 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2112 target RNA, herein designated GAM TARGET RNA. GAM2112 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[29444] GAM2112 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2112 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2112 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an

illustration only, and is not meant to be limiting GAM2112 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2112 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[29445] The complementary binding of GAM2112 RNA, herein designated GAM RNA, to target binding sites on GAM2112 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2112 target RNA, herein designated GAM TARGET RNA, into GAM2112 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[29446] It is appreciated that GAM2112 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2112 target genes. The mRNA of each one of this plurality of GAM2112 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2112 RNA, herein designated GAM RNA, and which when bound by GAM2112 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2112 target proteins.

[29447] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition

exerted by GAM2112 gene, herein designated GAM GENE, on one or more GAM2112 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[29448] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2112 correlate with, and may be deduced from, the identity of the target genes which GAM2112 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[29449] Nucleotide sequences of the GAM2112 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2112 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2112 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2112 are further described hereinbelow with reference to Table 1.

[29450] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2112 RNA, herein designated GAM RNA, are described hereinbelow

with reference to Table 2.

[29451] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2113 (GAM2113) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[29452] GAM2113 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2113 was detected is described hereinabove with reference to Figs. 2-8.

[29453] GAM2113 gene, herein designated GAM GENE, and GAM2113 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[29454] GAM2113 gene, herein designated GAM GENE, encodes a GAM2113 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2113 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2113 precursor RNA is designated SEQ ID:2090, and is provided hereinbelow with reference to the sequence listing part.

[29455] GAM2113 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2113 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA

encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[29456] An enzyme complex designated DICER COMPLEX, dices the GAM2113 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2113 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 86%) nucleotide sequence of GAM2113 RNA is designated SEQ ID:4701, and is provided hereinbelow with reference to the sequence listing part.

[29457] GAM2113 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2113 target RNA, herein designated GAM TARGET RNA. GAM2113 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[29458] GAM2113 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2113 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2113 RNA,

herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2113 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2113 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[29459] The complementary binding of GAM2113 RNA, herein designated GAM RNA, to target binding sites on GAM2113 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2113 target RNA, herein designated GAM TARGET RNA, into GAM2113 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[29460] It is appreciated that GAM2113 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2113 target genes. The mRNA of each one of this plurality of GAM2113 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2113 RNA, herein designated GAM RNA, and which when bound by GAM2113 RNA, herein designated GAM RNA,

causes inhibition of translation of respective one or more GAM2113 target proteins.

[29461] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2113 gene, herein designated GAM GENE, on one or more GAM2113 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[29462] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2113 correlate with, and may be deduced from, the identity of the target genes which GAM2113 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[29463] Nucleotide sequences of the GAM2113 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2113 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2113 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2113 are further described hereinbelow with reference to Table 1.

[29464] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2113 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[29465] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2114 (GAM2114) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[29466] GAM2114 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2114 was detected is described hereinabove with reference to Figs. 2-8.

[29467] GAM2114 gene, herein designated GAM GENE, and GAM2114 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[29468] GAM2114 gene, herein designated GAM GENE, encodes a GAM2114 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2114 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2114 precursor RNA is designated SEQ ID:2091, and is provided hereinbelow with reference to the sequence listing part.

[29469] GAM2114 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2114 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[29470] An enzyme complex designated DICER COMPLEX, dices the GAM2114 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2114 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 87%) nucleotide sequence of GAM2114 RNA is designated SEQ ID:4702, and is provided hereinbelow with reference to the sequence listing part.

[29471] GAM2114 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2114 target RNA, herein designated GAM TARGET RNA. GAM2114 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[29472] GAM2114 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2114 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2114 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2114 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2114 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[29473] The complementary binding of GAM2114 RNA, herein designated GAM RNA, to target binding sites on GAM2114 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2114 target RNA, herein designated GAM TARGET RNA, into GAM2114 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[29474] It is appreciated that GAM2114 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2114 target genes. The

mRNA of each one of this plurality of GAM2114 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2114 RNA, herein designated GAM RNA, and which when bound by GAM2114 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2114 target proteins.

[29475] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2114 gene, herein designated GAM GENE, on one or more GAM2114 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[29476] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2114 correlate with, and may be deduced from, the identity of the target genes which GAM2114 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[29477] Nucleotide sequences of the GAM2114 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2114 RNA, herein

designated GAM RNA, and a schematic representation of the secondary folding of GAM2114 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2114 are further described hereinbelow with reference to Table 1.

[29478] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2114 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[29479] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2115 (GAM2115) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[29480] GAM2115 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2115 was detected is described hereinabove with reference to Figs. 2-8.

[29481] GAM2115 gene, herein designated GAM GENE, and GAM2115 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[29482] GAM2115 gene, herein designated GAM GENE, encodes a GAM2115 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2115 precursor RNA,

herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2115 precursor RNA is designated SEQ ID:2092, and is provided hereinbelow with reference to the sequence listing part.

[29483] GAM2115 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2115 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[29484] An enzyme complex designated DICER COMPLEX, dices the GAM2115 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2115 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM2115 RNA is designated SEQ ID:4703, and is provided hereinbelow with reference to the sequence listing part.

[29485] GAM2115 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2115 target RNA, herein designated GAM TARGET RNA. GAM2115 target RNA, herein designated GAM

TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[29486] GAM2115 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2115 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2115 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2115 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2115 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[29487] The complementary binding of GAM2115 RNA, herein designated GAM RNA, to target binding sites on GAM2115 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2115 target RNA, herein designated GAM TARGET RNA, into GAM2115 target protein, herein

designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[29488] It is appreciated that GAM2115 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2115 target genes. The mRNA of each one of this plurality of GAM2115 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2115 RNA, herein designated GAM RNA, and which when bound by GAM2115 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2115 target proteins.

[29489] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2115 gene, herein designated GAM GENE, on one or more GAM2115 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[29490] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2115 correlate with, and may be deduced from, the identity of the target

genes which GAM2115 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[29491] Nucleotide sequences of the GAM2115 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2115 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2115 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2115 are further described hereinbelow with reference to Table 1.

[29492] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2115 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[29493] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2116 (GAM2116) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[29494] GAM2116 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2116 was detected is described hereinabove with reference to Figs. 2-8.

[29495] GAM2116 gene, herein designated GAM GENE, and GAM2116 target gene, herein designated GAM TARGET GENE, are human genes contained in the

human genome.

[29496] GAM2116 gene, herein designated GAM GENE, encodes a GAM2116 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2116 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2116 precursor RNA is designated SEQ ID:2093, and is provided hereinbelow with reference to the sequence listing part.

[29497] GAM2116 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2116 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[29498] An enzyme complex designated DICER COMPLEX, dices the GAM2116 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2116 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 78%) nucleotide sequence of GAM2116 RNA is designated SEQ ID:4704, and is provided

hereinbelow with reference to the sequence listing part.

[29499] GAM2116 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2116 target RNA, herein designated GAM TARGET RNA. GAM2116 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[29500] GAM2116 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2116 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2116 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2116 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2116 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[29501] The complementary binding of GAM2116 RNA, herein designated GAM RNA, to target binding sites on GAM2116 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2116 target RNA, herein designated GAM TARGET RNA, into GAM2116 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[29502] It is appreciated that GAM2116 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2116 target genes. The mRNA of each one of this plurality of GAM2116 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2116 RNA, herein designated GAM RNA, and which when bound by GAM2116 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2116 target proteins.

[29503] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2116 gene, herein designated GAM GENE, on one or more GAM2116 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding

sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[29504] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2116 correlate with, and may be deduced from, the identity of the target genes which GAM2116 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[29505] Nucleotide sequences of the GAM2116 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2116 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2116 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2116 are further described hereinbelow with reference to Table 1.

[29506] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2116 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[29507] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2117 (GAM2117) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[29508] GAM2117 is a novel bioinformatically detected regulatory, non protein

coding, micro RNA (miRNA) gene. The method by which GAM2117 was detected is described hereinabove with reference to Figs. 2-8.

[29509] GAM2117 gene, herein designated GAM GENE, and GAM2117 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[29510] GAM2117 gene, herein designated GAM GENE, encodes a GAM2117 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2117 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2117 precursor RNA is designated SEQ ID:2094, and is provided hereinbelow with reference to the sequence listing part.

[29511] GAM2117 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2117 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[29512] An enzyme complex designated DICER COMPLEX, dices the GAM2117 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2117 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin

structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 84%) nucleotide sequence of GAM2117 RNA is designated SEQ ID:4709, and is provided hereinbelow with reference to the sequence listing part.

[29513] GAM2117 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2117 target RNA, herein designated GAM TARGET RNA. GAM2117 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[29514] GAM2117 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2117 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2117 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2117 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2117 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target

binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[29515] The complementary binding of GAM2117 RNA, herein designated GAM RNA, to target binding sites on GAM2117 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2117 target RNA, herein designated GAM TARGET RNA, into GAM2117 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[29516] It is appreciated that GAM2117 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2117 target genes. The mRNA of each one of this plurality of GAM2117 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2117 RNA, herein designated GAM RNA, and which when bound by GAM2117 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2117 target proteins.

[29517] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2117 gene, herein designated GAM GENE, on one or more GAM2117 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary

binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[29518] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2117 correlate with, and may be deduced from, the identity of the target genes which GAM2117 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[29519] Nucleotide sequences of the GAM2117 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2117 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2117 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2117 are further described hereinbelow with reference to Table 1.

[29520] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2117 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[29521] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2118 (GAM2118) gene, which modulates

expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[29522] GAM2118 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2118 was detected is described hereinabove with reference to Figs. 2-8.

[29523] GAM2118 gene, herein designated GAM GENE, and GAM2118 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[29524] GAM2118 gene, herein designated GAM GENE, encodes a GAM2118 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2118 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2118 precursor RNA is designated SEQ ID:2095, and is provided hereinbelow with reference to the sequence listing part.

[29525] GAM2118 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2118 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[29526] An enzyme complex designated DICER COMPLEX, dices the GAM2118 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2118 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 83%) nucleotide sequence of GAM2118 RNA is designated SEQ ID:4708, and is provided hereinbelow with reference to the sequence listing part.

[29527] GAM2118 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2118 target RNA, herein designated GAM TARGET RNA. GAM2118 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[29528] GAM2118 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2118 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2118 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an

illustration only, and is not meant to be limiting GAM2118 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2118 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[29529] The complementary binding of GAM2118 RNA, herein designated GAM RNA, to target binding sites on GAM2118 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2118 target RNA, herein designated GAM TARGET RNA, into GAM2118 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[29530] It is appreciated that GAM2118 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2118 target genes. The mRNA of each one of this plurality of GAM2118 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2118 RNA, herein designated GAM RNA, and which when bound by GAM2118 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2118 target proteins.

[29531] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition

exerted by GAM2118 gene, herein designated GAM GENE, on one or more GAM2118 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[29532] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2118 correlate with, and may be deduced from, the identity of the target genes which GAM2118 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[29533] Nucleotide sequences of the GAM2118 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2118 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2118 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2118 are further described hereinbelow with reference to Table 1.

[29534] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2118 RNA, herein designated GAM RNA, are described hereinbelow

with reference to Table 2.

[29535] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2119 (GAM2119) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[29536] GAM2119 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2119 was detected is described hereinabove with reference to Figs. 2-8.

[29537] GAM2119 gene, herein designated GAM GENE, and GAM2119 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[29538] GAM2119 gene, herein designated GAM GENE, encodes a GAM2119 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2119 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2119 precursor RNA is designated SEQ ID:2096, and is provided hereinbelow with reference to the sequence listing part.

[29539] GAM2119 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2119 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA

encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[29540] An enzyme complex designated DICER COMPLEX, dices the GAM2119 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2119 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM2119 RNA is designated SEQ ID:4711, and is provided hereinbelow with reference to the sequence listing part.

[29541] GAM2119 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2119 target RNA, herein designated GAM TARGET RNA. GAM2119 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[29542] GAM2119 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2119 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2119 RNA,

herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2119 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2119 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[29543] The complementary binding of GAM2119 RNA, herein designated GAM RNA, to target binding sites on GAM2119 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2119 target RNA, herein designated GAM TARGET RNA, into GAM2119 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[29544] It is appreciated that GAM2119 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2119 target genes. The mRNA of each one of this plurality of GAM2119 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2119 RNA, herein designated GAM RNA, and which when bound by GAM2119 RNA, herein designated GAM RNA,

causes inhibition of translation of respective one or more GAM2119 target proteins.

[29545] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2119 gene, herein designated GAM GENE, on one or more GAM2119 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[29546] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2119 correlate with, and may be deduced from, the identity of the target genes which GAM2119 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[29547] Nucleotide sequences of the GAM2119 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2119 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2119 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2119 are further described hereinbelow with reference to Table 1.

[29548] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2119 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[29549] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2120 (GAM2120) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[29550] GAM2120 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2120 was detected is described hereinabove with reference to Figs. 2-8.

[29551] GAM2120 gene, herein designated GAM GENE, and GAM2120 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[29552] GAM2120 gene, herein designated GAM GENE, encodes a GAM2120 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2120 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2120 precursor RNA is designated SEQ ID:2097, and is provided hereinbelow with reference to the sequence listing part.

[29553] GAM2120 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2120 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[29554] An enzyme complex designated DICER COMPLEX, dices the GAM2120 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2120 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM2120 RNA is designated SEQ ID:4710, and is provided hereinbelow with reference to the sequence listing part.

[29555] GAM2120 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2120 target RNA, herein designated GAM TARGET RNA. GAM2120 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[29556] GAM2120 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2120 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2120 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2120 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2120 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[29557] The complementary binding of GAM2120 RNA, herein designated GAM RNA, to target binding sites on GAM2120 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2120 target RNA, herein designated GAM TARGET RNA, into GAM2120 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[29558] It is appreciated that GAM2120 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2120 target genes. The

mRNA of each one of this plurality of GAM2120 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2120 RNA, herein designated GAM RNA, and which when bound by GAM2120 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2120 target proteins.

[29559] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2120 gene, herein designated GAM GENE, on one or more GAM2120 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[29560] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2120 correlate with, and may be deduced from, the identity of the target genes which GAM2120 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[29561] Nucleotide sequences of the GAM2120 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2120 RNA, herein

designated GAM RNA, and a schematic representation of the secondary folding of GAM2120 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2120 are further described hereinbelow with reference to Table 1.

[29562] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2120 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[29563] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2121 (GAM2121) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[29564] GAM2121 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2121 was detected is described hereinabove with reference to Figs. 2-8.

[29565] GAM2121 gene, herein designated GAM GENE, and GAM2121 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[29566] GAM2121 gene, herein designated GAM GENE, encodes a GAM2121 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2121 precursor RNA,

herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2121 precursor RNA is designated SEQ ID:2098, and is provided hereinbelow with reference to the sequence listing part.

[29567] GAM2121 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2121 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[29568] An enzyme complex designated DICER COMPLEX, dices the GAM2121 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2121 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 88%) nucleotide sequence of GAM2121 RNA is designated SEQ ID:4712, and is provided hereinbelow with reference to the sequence listing part.

[29569] GAM2121 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2121 target RNA, herein designated GAM TARGET RNA. GAM2121 target RNA, herein designated GAM

TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[29570] GAM2121 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2121 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2121 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2121 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2121 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[29571] The complementary binding of GAM2121 RNA, herein designated GAM RNA, to target binding sites on GAM2121 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2121 target RNA, herein designated GAM TARGET RNA, into GAM2121 target protein, herein

designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[29572] It is appreciated that GAM2121 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2121 target genes. The mRNA of each one of this plurality of GAM2121 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2121 RNA, herein designated GAM RNA, and which when bound by GAM2121 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2121 target proteins.

[29573] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2121 gene, herein designated GAM GENE, on one or more GAM2121 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[29574] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2121 correlate with, and may be deduced from, the identity of the target

genes which GAM2121 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[29575] Nucleotide sequences of the GAM2121 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2121 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2121 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2121 are further described hereinbelow with reference to Table 1.

[29576] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2121 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[29577] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2122 (GAM2122) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[29578] GAM2122 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2122 was detected is described hereinabove with reference to Figs. 2-8.

[29579] GAM2122 gene, herein designated GAM GENE, and GAM2122 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[29580] GAM2122 gene, herein designated GAM GENE, encodes a GAM2122 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2122 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2122 precursor RNA is designated SEQ ID:2099, and is provided hereinbelow with reference to the sequence listing part.

[29581] GAM2122 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2122 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an

accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[29582] An enzyme complex designated DICER COMPLEX, dices the GAM2122 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2122 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM2122 RNA is designated SEQ ID:4713, and is provided hereinbelow with reference to the sequence listing part.

[29583] GAM2122 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2122 target RNA, herein designated GAM TARGET RNA. GAM2122 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[29584] GAM2122 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2122 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2122 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As

an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2122 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2122 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[29585] The complementary binding of GAM2122 RNA, herein designated GAM RNA, to target binding sites on GAM2122 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2122 target RNA, herein designated GAM TARGET RNA, into GAM2122 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[29586] It is appreciated that GAM2122 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2122 target genes. The mRNA of each one of this plurality of GAM2122 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2122 RNA, herein designated GAM RNA, and which when bound by GAM2122 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2122 target proteins.

[29587] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2122 gene, herein designated GAM GENE, on one or more GAM2122 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[29588] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2122 correlate with, and may be deduced from, the identity of the target genes which GAM2122 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[29589] Nucleotide sequences of the GAM2122 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2122 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2122 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2122 are further described hereinbelow with reference to Table 1.

[29590] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic

representation of the complementarity of each of these target binding sites to GAM2122 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[29591] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2123 (GAM2123) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[29592] GAM2123 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2123 was detected is described hereinabove with reference to Figs. 2-8.

[29593] GAM2123 gene, herein designated GAM GENE, and GAM2123 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[29594] GAM2123 gene, herein designated GAM GENE, encodes a GAM2123 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2123 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2123 precursor RNA is designated SEQ ID:2100, and is provided hereinbelow with reference to the sequence listing part.

[29595] GAM2123 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2123 folded precursor RNA, herein designated

GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[29596] An enzyme complex designated DICER COMPLEX, dices the GAM2123 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2123 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 81%) nucleotide sequence of GAM2123 RNA is designated SEQ ID:4714, and is provided hereinbelow with reference to the sequence listing part.

[29597] GAM2123 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2123 target RNA, herein designated GAM TARGET RNA. GAM2123 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[29598] GAM2123 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2123

target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2123 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2123 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2123 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[29599] The complementary binding of GAM2123 RNA, herein designated GAM RNA, to target binding sites on GAM2123 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2123 target RNA, herein designated GAM TARGET RNA, into GAM2123 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[29600] It is appreciated that GAM2123 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2123 target genes. The mRNA of each one of this plurality of GAM2123 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at

least partly complementary to GAM2123 RNA, herein designated GAM RNA, and which when bound by GAM2123 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2123 target proteins.

[29601] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2123 gene, herein designated GAM GENE, on one or more GAM2123 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[29602] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2123 correlate with, and may be deduced from, the identity of the target genes which GAM2123 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[29603] Nucleotide sequences of the GAM2123 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2123 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2123 folded precursor RNA, herein designated GAM

FOLDED PRECURSOR RNA, of GAM2123 are further described hereinbelow with reference to Table 1.

[29604] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2123 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[29605] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2124 (GAM2124) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[29606] GAM2124 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2124 was detected is described hereinabove with reference to Figs. 2-8.

[29607] GAM2124 gene, herein designated GAM GENE, and GAM2124 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[29608] GAM2124 gene, herein designated GAM GENE, encodes a GAM2124 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2124 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of

GAM2124 precursor RNA is designated SEQ ID:2101, and is provided hereinbelow with reference to the sequence listing part.

[29609] GAM2124 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2124 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[29610] An enzyme complex designated DICER COMPLEX, dices the GAM2124 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2124 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 81%) nucleotide sequence of GAM2124 RNA is designated SEQ ID:4715, and is provided hereinbelow with reference to the sequence listing part.

[29611] GAM2124 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2124 target RNA, herein designated GAM TARGET RNA. GAM2124 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3

untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[29612] GAM2124 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2124 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2124 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2124 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2124 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[29613] The complementary binding of GAM2124 RNA, herein designated GAM RNA, to target binding sites on GAM2124 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2124 target RNA, herein designated GAM TARGET RNA, into GAM2124 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[29614] It is appreciated that GAM2124 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2124 target genes. The mRNA of each one of this plurality of GAM2124 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2124 RNA, herein designated GAM RNA, and which when bound by GAM2124 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2124 target proteins.

[29615] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2124 gene, herein designated GAM GENE, on one or more GAM2124 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[29616] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2124 correlate with, and may be deduced from, the identity of the target genes which GAM2124 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[29617] Nucleotide sequences of the GAM2124 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2124 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2124 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2124 are further described hereinbelow with reference to Table 1.

[29618] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2124 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[29619] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2125 (GAM2125) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[29620] GAM2125 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2125 was detected is described hereinabove with reference to Figs. 2-8.

[29621] GAM2125 gene, herein designated GAM GENE, and GAM2125 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[29622] GAM2125 gene, herein designated GAM GENE, encodes a GAM2125

precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2125 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2125 precursor RNA is designated SEQ ID:2102, and is provided hereinbelow with reference to the sequence listing part.

[29623] GAM2125 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2125 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[29624] An enzyme complex designated DICER COMPLEX, dices the GAM2125 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2125 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 80%) nucleotide sequence of GAM2125 RNA is designated SEQ ID:4716, and is provided hereinbelow with reference to the sequence listing part.

[29625] GAM2125 target gene, herein designated GAM TARGET GENE, encodes a

corresponding messenger RNA, GAM2125 target RNA, herein designated GAM TARGET RNA. GAM2125 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[29626] GAM2125 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2125 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2125 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2125 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2125 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[29627] The complementary binding of GAM2125 RNA, herein designated GAM RNA, to target binding sites on GAM2125 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and

BINDING SITE III, inhibits translation of GAM2125 target RNA, herein designated GAM TARGET RNA, into GAM2125 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[29628] It is appreciated that GAM2125 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2125 target genes. The mRNA of each one of this plurality of GAM2125 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2125 RNA, herein designated GAM RNA, and which when bound by GAM2125 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2125 target proteins.

[29629] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2125 gene, herein designated GAM GENE, on one or more GAM2125 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[29630] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2125 correlate with, and may be deduced from, the identity of the target genes which GAM2125 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[29631] Nucleotide sequences of the GAM2125 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2125 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2125 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2125 are further described hereinbelow with reference to Table 1.

[29632] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2125 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[29633] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2126 (GAM2126) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[29634] GAM2126 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2126 was detected is described hereinabove with reference to Figs. 2-8.

[29635] GAM2126 gene, herein designated GAM GENE, and GAM2126 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[29636] GAM2126 gene, herein designated GAM GENE, encodes a GAM2126 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2126 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2126 precursor RNA is designated SEQ ID:2103, and is provided hereinbelow with reference to the sequence listing part.

[29637] GAM2126 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2126 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[29638] An enzyme complex designated DICER COMPLEX, dices the GAM2126 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2126 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer

together with other necessary proteins. A probable (over 79%) nucleotide sequence of GAM2126 RNA is designated SEQ ID:4718, and is provided hereinbelow with reference to the sequence listing part.

[29639] GAM2126 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2126 target RNA, herein designated GAM TARGET RNA. GAM2126 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[29640] GAM2126 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2126 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2126 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2126 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2126 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or

in both 3UTR and 5UTR regions.

[29641] The complementary binding of GAM2126 RNA, herein designated GAM RNA, to target binding sites on GAM2126 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2126 target RNA, herein designated GAM TARGET RNA, into GAM2126 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[29642] It is appreciated that GAM2126 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2126 target genes. The mRNA of each one of this plurality of GAM2126 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2126 RNA, herein designated GAM RNA, and which when bound by GAM2126 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2126 target proteins.

[29643] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2126 gene, herein designated GAM GENE, on one or more GAM2126 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes

are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[29644] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2126 correlate with, and may be deduced from, the identity of the target genes which GAM2126 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[29645] Nucleotide sequences of the GAM2126 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2126 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2126 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2126 are further described hereinbelow with reference to Table 1.

[29646] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2126 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[29647] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2127 (GAM2127) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[29648] GAM2127 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2127 was detected is described hereinabove with reference to Figs. 2-8.

[29649] GAM2127 gene, herein designated GAM GENE, and GAM2127 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[29650] GAM2127 gene, herein designated GAM GENE, encodes a GAM2127 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2127 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2127 precursor RNA is designated SEQ ID:2104, and is provided hereinbelow with reference to the sequence listing part.

[29651] GAM2127 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2127 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[29652] An enzyme complex designated DICER COMPLEX, dices the GAM2127 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2127 RNA, herein designated GAM RNA, a single stranded

~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM2127 RNA is designated SEQ ID:4717, and is provided hereinbelow with reference to the sequence listing part.

[29653] GAM2127 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2127 target RNA, herein designated GAM TARGET RNA. GAM2127 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[29654] GAM2127 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2127 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2127 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2127 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2127 target RNA, herein designated GAM

TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[29655] The complementary binding of GAM2127 RNA, herein designated GAM RNA, to target binding sites on GAM2127 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2127 target RNA, herein designated GAM TARGET RNA, into GAM2127 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[29656] It is appreciated that GAM2127 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2127 target genes. The mRNA of each one of this plurality of GAM2127 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2127 RNA, herein designated GAM RNA, and which when bound by GAM2127 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2127 target proteins.

[29657] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2127 gene, herein designated GAM GENE, on one or more GAM2127 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with

reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[29658] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2127 correlate with, and may be deduced from, the identity of the target genes which GAM2127 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[29659] Nucleotide sequences of the GAM2127 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2127 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2127 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2127 are further described hereinbelow with reference to Table 1.

[29660] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2127 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[29661] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as

Genomic Address Messenger 2128 (GAM2128) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[29662] GAM2128 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2128 was detected is described hereinabove with reference to Figs. 2-8.

[29663] GAM2128 gene, herein designated GAM GENE, and GAM2128 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[29664] GAM2128 gene, herein designated GAM GENE, encodes a GAM2128 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2128 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2128 precursor RNA is designated SEQ ID:2105, and is provided hereinbelow with reference to the sequence listing part.

[29665] GAM2128 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2128 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[29666] An enzyme complex designated DICER COMPLEX, dices the GAM2128 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2128 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 87%) nucleotide sequence of GAM2128 RNA is designated SEQ ID:4719, and is provided hereinbelow with reference to the sequence listing part.

[29667] GAM2128 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2128 target RNA, herein designated GAM TARGET RNA. GAM2128 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[29668] GAM2128 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2128 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2128 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an

illustration only, and is not meant to be limiting GAM2128 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2128 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[29669] The complementary binding of GAM2128 RNA, herein designated GAM RNA, to target binding sites on GAM2128 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2128 target RNA, herein designated GAM TARGET RNA, into GAM2128 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[29670] It is appreciated that GAM2128 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2128 target genes. The mRNA of each one of this plurality of GAM2128 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2128 RNA, herein designated GAM RNA, and which when bound by GAM2128 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2128 target proteins.

[29671] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition

exerted by GAM2128 gene, herein designated GAM GENE, on one or more GAM2128 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[29672] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2128 correlate with, and may be deduced from, the identity of the target genes which GAM2128 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[29673] Nucleotide sequences of the GAM2128 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2128 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2128 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2128 are further described hereinbelow with reference to Table 1.

[29674] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2128 RNA, herein designated GAM RNA, are described hereinbelow

with reference to Table 2.

[29675] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2129 (GAM2129) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[29676] GAM2129 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2129 was detected is described hereinabove with reference to Figs. 2-8.

[29677] GAM2129 gene, herein designated GAM GENE, and GAM2129 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[29678] GAM2129 gene, herein designated GAM GENE, encodes a GAM2129 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2129 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2129 precursor RNA is designated SEQ ID:2106, and is provided hereinbelow with reference to the sequence listing part.

[29679] GAM2129 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2129 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA

encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[29680] An enzyme complex designated DICER COMPLEX, dices the GAM2129 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2129 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 82%) nucleotide sequence of GAM2129 RNA is designated SEQ ID:4721, and is provided hereinbelow with reference to the sequence listing part.

[29681] GAM2129 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2129 target RNA, herein designated GAM TARGET RNA. GAM2129 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[29682] GAM2129 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2129 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2129 RNA,

herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2129 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2129 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[29683] The complementary binding of GAM2129 RNA, herein designated GAM RNA, to target binding sites on GAM2129 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2129 target RNA, herein designated GAM TARGET RNA, into GAM2129 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[29684] It is appreciated that GAM2129 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2129 target genes. The mRNA of each one of this plurality of GAM2129 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2129 RNA, herein designated GAM RNA, and which when bound by GAM2129 RNA, herein designated GAM RNA,

causes inhibition of translation of respective one or more GAM2129 target proteins.

[29685] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2129 gene, herein designated GAM GENE, on one or more GAM2129 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[29686] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2129 correlate with, and may be deduced from, the identity of the target genes which GAM2129 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[29687] Nucleotide sequences of the GAM2129 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2129 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2129 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2129 are further described hereinbelow with reference to Table 1.

[29688] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2129 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[29689] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2130 (GAM2130) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[29690] GAM2130 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2130 was detected is described hereinabove with reference to Figs. 2-8.

[29691] GAM2130 gene, herein designated GAM GENE, and GAM2130 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[29692] GAM2130 gene, herein designated GAM GENE, encodes a GAM2130 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2130 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2130 precursor RNA is designated SEQ ID:2107, and is provided hereinbelow with reference to the sequence listing part.

[29693] GAM2130 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2130 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[29694] An enzyme complex designated DICER COMPLEX, dices the GAM2130 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2130 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM2130 RNA is designated SEQ ID:4720, and is provided hereinbelow with reference to the sequence listing part.

[29695] GAM2130 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2130 target RNA, herein designated GAM TARGET RNA. GAM2130 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[29696] GAM2130 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2130 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2130 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2130 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2130 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[29697] The complementary binding of GAM2130 RNA, herein designated GAM RNA, to target binding sites on GAM2130 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2130 target RNA, herein designated GAM TARGET RNA, into GAM2130 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[29698] It is appreciated that GAM2130 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2130 target genes. The

mRNA of each one of this plurality of GAM2130 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2130 RNA, herein designated GAM RNA, and which when bound by GAM2130 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2130 target proteins.

[29699] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2130 gene, herein designated GAM GENE, on one or more GAM2130 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[29700] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2130 correlate with, and may be deduced from, the identity of the target genes which GAM2130 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[29701] Nucleotide sequences of the GAM2130 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2130 RNA, herein

designated GAM RNA, and a schematic representation of the secondary folding of GAM2130 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2130 are further described hereinbelow with reference to Table 1.

[29702] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2130 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[29703] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2131 (GAM2131) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[29704] GAM2131 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2131 was detected is described hereinabove with reference to Figs. 2-8.

[29705] GAM2131 gene, herein designated GAM GENE, and GAM2131 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[29706] GAM2131 gene, herein designated GAM GENE, encodes a GAM2131 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2131 precursor RNA,

herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2131 precursor RNA is designated SEQ ID:2108, and is provided hereinbelow with reference to the sequence listing part.

[29707] GAM2131 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2131 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[29708] An enzyme complex designated DICER COMPLEX, dices the GAM2131 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2131 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 80%) nucleotide sequence of GAM2131 RNA is designated SEQ ID:4722, and is provided hereinbelow with reference to the sequence listing part.

[29709] GAM2131 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2131 target RNA, herein designated GAM TARGET RNA. GAM2131 target RNA, herein designated GAM

TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[29710] GAM2131 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2131 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2131 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2131 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2131 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[29711] The complementary binding of GAM2131 RNA, herein designated GAM RNA, to target binding sites on GAM2131 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2131 target RNA, herein designated GAM TARGET RNA, into GAM2131 target protein, herein

designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[29712] It is appreciated that GAM2131 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2131 target genes. The mRNA of each one of this plurality of GAM2131 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2131 RNA, herein designated GAM RNA, and which when bound by GAM2131 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2131 target proteins.

[29713] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2131 gene, herein designated GAM GENE, on one or more GAM2131 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[29714] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2131 correlate with, and may be deduced from, the identity of the target

genes which GAM2131 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[29715] Nucleotide sequences of the GAM2131 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2131 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2131 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2131 are further described hereinbelow with reference to Table 1.

[29716] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2131 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[29717] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2132 (GAM2132) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[29718] GAM2132 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2132 was detected is described hereinabove with reference to Figs. 2-8.

[29719] GAM2132 gene, herein designated GAM GENE, and GAM2132 target gene, herein designated GAM TARGET GENE, are human genes contained in the

human genome.

[29720] GAM2132 gene, herein designated GAM GENE, encodes a GAM2132 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2132 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2132 precursor RNA is designated SEQ ID:2109, and is provided hereinbelow with reference to the sequence listing part.

[29721] GAM2132 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2132 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[29722] An enzyme complex designated DICER COMPLEX, dices the GAM2132 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2132 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 82%) nucleotide sequence of GAM2132 RNA is designated SEQ ID:4723, and is provided

hereinbelow with reference to the sequence listing part.

[29723] GAM2132 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2132 target RNA, herein designated GAM TARGET RNA. GAM2132 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[29724] GAM2132 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2132 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2132 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2132 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2132 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[29725] The complementary binding of GAM2132 RNA, herein designated GAM RNA, to target binding sites on GAM2132 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2132 target RNA, herein designated GAM TARGET RNA, into GAM2132 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[29726] It is appreciated that GAM2132 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2132 target genes. The mRNA of each one of this plurality of GAM2132 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2132 RNA, herein designated GAM RNA, and which when bound by GAM2132 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2132 target proteins.

[29727] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2132 gene, herein designated GAM GENE, on one or more GAM2132 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding

sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[29728] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2132 correlate with, and may be deduced from, the identity of the target genes which GAM2132 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[29729] Nucleotide sequences of the GAM2132 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2132 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2132 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2132 are further described hereinbelow with reference to Table 1.

[29730] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2132 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[29731] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2133 (GAM2133) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[29732] GAM2133 is a novel bioinformatically detected regulatory, non protein

coding, micro RNA (miRNA) gene. The method by which GAM2133 was detected is described hereinabove with reference to Figs. 2-8.

[29733] GAM2133 gene, herein designated GAM GENE, and GAM2133 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[29734] GAM2133 gene, herein designated GAM GENE, encodes a GAM2133 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2133 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2133 precursor RNA is designated SEQ ID:2110, and is provided hereinbelow with reference to the sequence listing part.

[29735] GAM2133 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2133 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[29736] An enzyme complex designated DICER COMPLEX, dices the GAM2133 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2133 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin

structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 87%) nucleotide sequence of GAM2133 RNA is designated SEQ ID:4724, and is provided hereinbelow with reference to the sequence listing part.

[29737] GAM2133 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2133 target RNA, herein designated GAM TARGET RNA. GAM2133 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[29738] GAM2133 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2133 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2133 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2133 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2133 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target

binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[29739] The complementary binding of GAM2133 RNA, herein designated GAM RNA, to target binding sites on GAM2133 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2133 target RNA, herein designated GAM TARGET RNA, into GAM2133 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[29740] It is appreciated that GAM2133 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2133 target genes. The mRNA of each one of this plurality of GAM2133 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2133 RNA, herein designated GAM RNA, and which when bound by GAM2133 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2133 target proteins.

[29741] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2133 gene, herein designated GAM GENE, on one or more GAM2133 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary

binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[29742] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2133 correlate with, and may be deduced from, the identity of the target genes which GAM2133 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[29743] Nucleotide sequences of the GAM2133 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2133 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2133 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2133 are further described hereinbelow with reference to Table 1.

[29744] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2133 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[29745] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2134 (GAM2134) gene, which modulates

expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[29746] GAM2134 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2134 was detected is described hereinabove with reference to Figs. 2-8.

[29747] GAM2134 gene, herein designated GAM GENE, and GAM2134 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[29748] GAM2134 gene, herein designated GAM GENE, encodes a GAM2134 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2134 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2134 precursor RNA is designated SEQ ID:2111, and is provided hereinbelow with reference to the sequence listing part.

[29749] GAM2134 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2134 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[29750] An enzyme complex designated DICER COMPLEX, dices the GAM2134 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2134 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 82%) nucleotide sequence of GAM2134 RNA is designated SEQ ID:4725, and is provided hereinbelow with reference to the sequence listing part.

[29751] GAM2134 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2134 target RNA, herein designated GAM TARGET RNA. GAM2134 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[29752] GAM2134 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2134 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2134 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an

illustration only, and is not meant to be limiting GAM2134 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2134 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[29753] The complementary binding of GAM2134 RNA, herein designated GAM RNA, to target binding sites on GAM2134 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2134 target RNA, herein designated GAM TARGET RNA, into GAM2134 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[29754] It is appreciated that GAM2134 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2134 target genes. The mRNA of each one of this plurality of GAM2134 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2134 RNA, herein designated GAM RNA, and which when bound by GAM2134 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2134 target proteins.

[29755] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition

exerted by GAM2134 gene, herein designated GAM GENE, on one or more GAM2134 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[29756] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2134 correlate with, and may be deduced from, the identity of the target genes which GAM2134 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[29757] Nucleotide sequences of the GAM2134 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2134 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2134 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2134 are further described hereinbelow with reference to Table 1.

[29758] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2134 RNA, herein designated GAM RNA, are described hereinbelow

with reference to Table 2.

[29759] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2135 (GAM2135) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[29760] GAM2135 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2135 was detected is described hereinabove with reference to Figs. 2-8.

[29761] GAM2135 gene, herein designated GAM GENE, and GAM2135 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[29762] GAM2135 gene, herein designated GAM GENE, encodes a GAM2135 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2135 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2135 precursor RNA is designated SEQ ID:2112, and is provided hereinbelow with reference to the sequence listing part.

[29763] GAM2135 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2135 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA

encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[29764] An enzyme complex designated DICER COMPLEX, dices the GAM2135 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2135 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 87%) nucleotide sequence of GAM2135 RNA is designated SEQ ID:4726, and is provided hereinbelow with reference to the sequence listing part.

[29765] GAM2135 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2135 target RNA, herein designated GAM TARGET RNA. GAM2135 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[29766] GAM2135 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2135 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2135 RNA,

herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2135 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2135 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[29767] The complementary binding of GAM2135 RNA, herein designated GAM RNA, to target binding sites on GAM2135 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2135 target RNA, herein designated GAM TARGET RNA, into GAM2135 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[29768] It is appreciated that GAM2135 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2135 target genes. The mRNA of each one of this plurality of GAM2135 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2135 RNA, herein designated GAM RNA, and which when bound by GAM2135 RNA, herein designated GAM RNA,

causes inhibition of translation of respective one or more GAM2135 target proteins.

[29769] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2135 gene, herein designated GAM GENE, on one or more GAM2135 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[29770] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2135 correlate with, and may be deduced from, the identity of the target genes which GAM2135 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[29771] Nucleotide sequences of the GAM2135 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2135 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2135 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2135 are further described hereinbelow with reference to Table 1.

[29772] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2135 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[29773] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2136 (GAM2136) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[29774] GAM2136 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2136 was detected is described hereinabove with reference to Figs. 2-8.

[29775] GAM2136 gene, herein designated GAM GENE, and GAM2136 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[29776] GAM2136 gene, herein designated GAM GENE, encodes a GAM2136 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2136 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2136 precursor RNA is designated SEQ ID:2113, and is provided hereinbelow with reference to the sequence listing part.

[29777] GAM2136 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2136 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[29778] An enzyme complex designated DICER COMPLEX, dices the GAM2136 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2136 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 87%) nucleotide sequence of GAM2136 RNA is designated SEQ ID:4727, and is provided hereinbelow with reference to the sequence listing part.

[29779] GAM2136 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2136 target RNA, herein designated GAM TARGET RNA. GAM2136 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[29780] GAM2136 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2136 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2136 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2136 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2136 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[29781] The complementary binding of GAM2136 RNA, herein designated GAM RNA, to target binding sites on GAM2136 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2136 target RNA, herein designated GAM TARGET RNA, into GAM2136 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[29782] It is appreciated that GAM2136 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2136 target genes. The

mRNA of each one of this plurality of GAM2136 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2136 RNA, herein designated GAM RNA, and which when bound by GAM2136 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2136 target proteins.

[29783] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2136 gene, herein designated GAM GENE, on one or more GAM2136 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[29784] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2136 correlate with, and may be deduced from, the identity of the target genes which GAM2136 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[29785] Nucleotide sequences of the GAM2136 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2136 RNA, herein

designated GAM RNA, and a schematic representation of the secondary folding of GAM2136 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2136 are further described hereinbelow with reference to Table 1.

[29786] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2136 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[29787] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2137 (GAM2137) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[29788] GAM2137 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2137 was detected is described hereinabove with reference to Figs. 2-8.

[29789] GAM2137 gene, herein designated GAM GENE, and GAM2137 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[29790] GAM2137 gene, herein designated GAM GENE, encodes a GAM2137 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2137 precursor RNA,

herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2137 precursor RNA is designated SEQ ID:2114, and is provided hereinbelow with reference to the sequence listing part.

[29791] GAM2137 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2137 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[29792] An enzyme complex designated DICER COMPLEX, dices the GAM2137 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2137 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 87%) nucleotide sequence of GAM2137 RNA is designated SEQ ID:4728, and is provided hereinbelow with reference to the sequence listing part.

[29793] GAM2137 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2137 target RNA, herein designated GAM TARGET RNA. GAM2137 target RNA, herein designated GAM

TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[29794] GAM2137 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2137 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2137 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2137 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2137 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[29795] The complementary binding of GAM2137 RNA, herein designated GAM RNA, to target binding sites on GAM2137 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2137 target RNA, herein designated GAM TARGET RNA, into GAM2137 target protein, herein

designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[29796] It is appreciated that GAM2137 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2137 target genes. The mRNA of each one of this plurality of GAM2137 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2137 RNA, herein designated GAM RNA, and which when bound by GAM2137 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2137 target proteins.

[29797] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2137 gene, herein designated GAM GENE, on one or more GAM2137 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[29798] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2137 correlate with, and may be deduced from, the identity of the target

genes which GAM2137 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[29799] Nucleotide sequences of the GAM2137 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2137 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2137 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2137 are further described hereinbelow with reference to Table 1.

[29800] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2137 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[29801] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2138 (GAM2138) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[29802] GAM2138 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2138 was detected is described hereinabove with reference to Figs. 2-8.

[29803] GAM2138 gene, herein designated GAM GENE, and GAM2138 target gene, herein designated GAM TARGET GENE, are human genes contained in the

human genome.

[29804] GAM2138 gene, herein designated GAM GENE, encodes a GAM2138 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2138 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2138 precursor RNA is designated SEQ ID:2115, and is provided hereinbelow with reference to the sequence listing part.

[29805] GAM2138 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2138 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[29806] An enzyme complex designated DICER COMPLEX, dices the GAM2138 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2138 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 79%) nucleotide sequence of GAM2138 RNA is designated SEQ ID:4730, and is provided

hereinbelow with reference to the sequence listing part.

[29807] GAM2138 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2138 target RNA, herein designated GAM TARGET RNA. GAM2138 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[29808] GAM2138 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2138 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2138 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2138 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2138 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[29809] The complementary binding of GAM2138 RNA, herein designated GAM RNA, to target binding sites on GAM2138 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2138 target RNA, herein designated GAM TARGET RNA, into GAM2138 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[29810] It is appreciated that GAM2138 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2138 target genes. The mRNA of each one of this plurality of GAM2138 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2138 RNA, herein designated GAM RNA, and which when bound by GAM2138 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2138 target proteins.

[29811] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2138 gene, herein designated GAM GENE, on one or more GAM2138 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding

sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[29812] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2138 correlate with, and may be deduced from, the identity of the target genes which GAM2138 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[29813] Nucleotide sequences of the GAM2138 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2138 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2138 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2138 are further described hereinbelow with reference to Table 1.

[29814] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2138 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[29815] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2139 (GAM2139) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[29816] GAM2139 is a novel bioinformatically detected regulatory, non protein

coding, micro RNA (miRNA) gene. The method by which GAM2139 was detected is described hereinabove with reference to Figs. 2-8.

[29817] GAM2139 gene, herein designated GAM GENE, and GAM2139 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[29818] GAM2139 gene, herein designated GAM GENE, encodes a GAM2139 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2139 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2139 precursor RNA is designated SEQ ID:2116, and is provided hereinbelow with reference to the sequence listing part.

[29819] GAM2139 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2139 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[29820] An enzyme complex designated DICER COMPLEX, dices the GAM2139 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2139 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin

structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM2139 RNA is designated SEQ ID:4729, and is provided hereinbelow with reference to the sequence listing part.

[29821] GAM2139 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2139 target RNA, herein designated GAM TARGET RNA. GAM2139 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[29822] GAM2139 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2139 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2139 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2139 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2139 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target

binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[29823] The complementary binding of GAM2139 RNA, herein designated GAM RNA, to target binding sites on GAM2139 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2139 target RNA, herein designated GAM TARGET RNA, into GAM2139 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[29824] It is appreciated that GAM2139 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2139 target genes. The mRNA of each one of this plurality of GAM2139 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2139 RNA, herein designated GAM RNA, and which when bound by GAM2139 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2139 target proteins.

[29825] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2139 gene, herein designated GAM GENE, on one or more GAM2139 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary

binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[29826] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2139 correlate with, and may be deduced from, the identity of the target genes which GAM2139 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[29827] Nucleotide sequences of the GAM2139 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2139 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2139 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2139 are further described hereinbelow with reference to Table 1.

[29828] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2139 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[29829] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2140 (GAM2140) gene, which modulates

expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[29830] GAM2140 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2140 was detected is described hereinabove with reference to Figs. 2-8.

[29831] GAM2140 gene, herein designated GAM GENE, and GAM2140 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[29832] GAM2140 gene, herein designated GAM GENE, encodes a GAM2140 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2140 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2140 precursor RNA is designated SEQ ID:2117, and is provided hereinbelow with reference to the sequence listing part.

[29833] GAM2140 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2140 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[29834] An enzyme complex designated DICER COMPLEX, dices the GAM2140 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2140 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 85%) nucleotide sequence of GAM2140 RNA is designated SEQ ID:4733, and is provided hereinbelow with reference to the sequence listing part.

[29835] GAM2140 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2140 target RNA, herein designated GAM TARGET RNA. GAM2140 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[29836] GAM2140 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2140 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2140 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an

illustration only, and is not meant to be limiting GAM2140 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2140 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[29837] The complementary binding of GAM2140 RNA, herein designated GAM RNA, to target binding sites on GAM2140 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2140 target RNA, herein designated GAM TARGET RNA, into GAM2140 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[29838] It is appreciated that GAM2140 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2140 target genes. The mRNA of each one of this plurality of GAM2140 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2140 RNA, herein designated GAM RNA, and which when bound by GAM2140 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2140 target proteins.

[29839] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition

exerted by GAM2140 gene, herein designated GAM GENE, on one or more GAM2140 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[29840] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2140 correlate with, and may be deduced from, the identity of the target genes which GAM2140 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[29841] Nucleotide sequences of the GAM2140 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2140 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2140 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2140 are further described hereinbelow with reference to Table 1.

[29842] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2140 RNA, herein designated GAM RNA, are described hereinbelow

with reference to Table 2.

[29843] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2141 (GAM2141) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[29844] GAM2141 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2141 was detected is described hereinabove with reference to Figs. 2-8.

[29845] GAM2141 gene, herein designated GAM GENE, and GAM2141 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[29846] GAM2141 gene, herein designated GAM GENE, encodes a GAM2141 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2141 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2141 precursor RNA is designated SEQ ID:2118, and is provided hereinbelow with reference to the sequence listing part.

[29847] GAM2141 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2141 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA

encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[29848] An enzyme complex designated DICER COMPLEX, dices the GAM2141 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2141 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 85%) nucleotide sequence of GAM2141 RNA is designated SEQ ID:4732, and is provided hereinbelow with reference to the sequence listing part.

[29849] GAM2141 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2141 target RNA, herein designated GAM TARGET RNA. GAM2141 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[29850] GAM2141 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2141 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2141 RNA,

herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2141 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2141 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[29851] The complementary binding of GAM2141 RNA, herein designated GAM RNA, to target binding sites on GAM2141 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2141 target RNA, herein designated GAM TARGET RNA, into GAM2141 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[29852] It is appreciated that GAM2141 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2141 target genes. The mRNA of each one of this plurality of GAM2141 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2141 RNA, herein designated GAM RNA, and which when bound by GAM2141 RNA, herein designated GAM RNA,

causes inhibition of translation of respective one or more GAM2141 target proteins.

[29853] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2141 gene, herein designated GAM GENE, on one or more GAM2141 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[29854] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2141 correlate with, and may be deduced from, the identity of the target genes which GAM2141 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[29855] Nucleotide sequences of the GAM2141 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2141 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2141 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2141 are further described hereinbelow with reference to Table 1.

[29856] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2141 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[29857] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2142 (GAM2142) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[29858] GAM2142 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2142 was detected is described hereinabove with reference to Figs. 2-8.

[29859] GAM2142 gene, herein designated GAM GENE, and GAM2142 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[29860] GAM2142 gene, herein designated GAM GENE, encodes a GAM2142 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2142 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2142 precursor RNA is designated SEQ ID:2119, and is provided hereinbelow with reference to the sequence listing part.

[29861] GAM2142 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2142 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[29862] An enzyme complex designated DICER COMPLEX, dices the GAM2142 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2142 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 86%) nucleotide sequence of GAM2142 RNA is designated SEQ ID:4731, and is provided hereinbelow with reference to the sequence listing part.

[29863] GAM2142 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2142 target RNA, herein designated GAM TARGET RNA. GAM2142 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[29864] GAM2142 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2142 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2142 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2142 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2142 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[29865] The complementary binding of GAM2142 RNA, herein designated GAM RNA, to target binding sites on GAM2142 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2142 target RNA, herein designated GAM TARGET RNA, into GAM2142 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[29866] It is appreciated that GAM2142 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2142 target genes. The

mRNA of each one of this plurality of GAM2142 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2142 RNA, herein designated GAM RNA, and which when bound by GAM2142 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2142 target proteins.

[29867] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2142 gene, herein designated GAM GENE, on one or more GAM2142 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[29868] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2142 correlate with, and may be deduced from, the identity of the target genes which GAM2142 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[29869] Nucleotide sequences of the GAM2142 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2142 RNA, herein

designated GAM RNA, and a schematic representation of the secondary folding of GAM2142 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2142 are further described hereinbelow with reference to Table 1.

[29870] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2142 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[29871] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2143 (GAM2143) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[29872] GAM2143 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2143 was detected is described hereinabove with reference to Figs. 2-8.

[29873] GAM2143 gene, herein designated GAM GENE, and GAM2143 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[29874] GAM2143 gene, herein designated GAM GENE, encodes a GAM2143 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2143 precursor RNA,

herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2143 precursor RNA is designated SEQ ID:2120, and is provided hereinbelow with reference to the sequence listing part.

[29875] GAM2143 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2143 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[29876] An enzyme complex designated DICER COMPLEX, dices the GAM2143 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2143 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 78%) nucleotide sequence of GAM2143 RNA is designated SEQ ID:4734, and is provided hereinbelow with reference to the sequence listing part.

[29877] GAM2143 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2143 target RNA, herein designated GAM TARGET RNA. GAM2143 target RNA, herein designated GAM

TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[29878] GAM2143 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2143 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2143 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2143 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2143 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[29879] The complementary binding of GAM2143 RNA, herein designated GAM RNA, to target binding sites on GAM2143 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2143 target RNA, herein designated GAM TARGET RNA, into GAM2143 target protein, herein

designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[29880] It is appreciated that GAM2143 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2143 target genes. The mRNA of each one of this plurality of GAM2143 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2143 RNA, herein designated GAM RNA, and which when bound by GAM2143 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2143 target proteins.

[29881] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2143 gene, herein designated GAM GENE, on one or more GAM2143 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[29882] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2143 correlate with, and may be deduced from, the identity of the target

genes which GAM2143 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[29883] Nucleotide sequences of the GAM2143 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2143 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2143 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2143 are further described hereinbelow with reference to Table 1.

[29884] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2143 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[29885] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2144 (GAM2144) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[29886] GAM2144 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2144 was detected is described hereinabove with reference to Figs. 2-8.

[29887] GAM2144 gene, herein designated GAM GENE, and GAM2144 target gene, herein designated GAM TARGET GENE, are human genes contained in the

human genome.

[29888] GAM2144 gene, herein designated GAM GENE, encodes a GAM2144 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2144 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2144 precursor RNA is designated SEQ ID:2121, and is provided hereinbelow with reference to the sequence listing part.

[29889] GAM2144 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2144 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[29890] An enzyme complex designated DICER COMPLEX, dices the GAM2144 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2144 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM2144 RNA is designated SEQ ID:4735, and is provided

hereinbelow with reference to the sequence listing part.

[29891] GAM2144 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2144 target RNA, herein designated GAM TARGET RNA. GAM2144 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[29892] GAM2144 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2144 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2144 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2144 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2144 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[29893] The complementary binding of GAM2144 RNA, herein designated GAM RNA, to target binding sites on GAM2144 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2144 target RNA, herein designated GAM TARGET RNA, into GAM2144 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[29894] It is appreciated that GAM2144 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2144 target genes. The mRNA of each one of this plurality of GAM2144 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2144 RNA, herein designated GAM RNA, and which when bound by GAM2144 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2144 target proteins.

[29895] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2144 gene, herein designated GAM GENE, on one or more GAM2144 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding

sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[29896] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2144 correlate with, and may be deduced from, the identity of the target genes which GAM2144 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[29897] Nucleotide sequences of the GAM2144 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2144 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2144 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2144 are further described hereinbelow with reference to Table 1.

[29898] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2144 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[29899] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2145 (GAM2145) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[29900] GAM2145 is a novel bioinformatically detected regulatory, non protein

coding, micro RNA (miRNA) gene. The method by which GAM2145 was detected is described hereinabove with reference to Figs. 2-8.

[29901] GAM2145 gene, herein designated GAM GENE, and GAM2145 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[29902] GAM2145 gene, herein designated GAM GENE, encodes a GAM2145 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2145 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2145 precursor RNA is designated SEQ ID:2122, and is provided hereinbelow with reference to the sequence listing part.

[29903] GAM2145 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2145 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[29904] An enzyme complex designated DICER COMPLEX, dices the GAM2145 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2145 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin

structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM2145 RNA is designated SEQ ID:4736, and is provided hereinbelow with reference to the sequence listing part.

[29905] GAM2145 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2145 target RNA, herein designated GAM TARGET RNA. GAM2145 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[29906] GAM2145 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2145 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2145 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2145 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2145 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target

binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[29907] The complementary binding of GAM2145 RNA, herein designated GAM RNA, to target binding sites on GAM2145 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2145 target RNA, herein designated GAM TARGET RNA, into GAM2145 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[29908] It is appreciated that GAM2145 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2145 target genes. The mRNA of each one of this plurality of GAM2145 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2145 RNA, herein designated GAM RNA, and which when bound by GAM2145 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2145 target proteins.

[29909] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2145 gene, herein designated GAM GENE, on one or more GAM2145 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary

binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[29910] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2145 correlate with, and may be deduced from, the identity of the target genes which GAM2145 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[29911] Nucleotide sequences of the GAM2145 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2145 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2145 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2145 are further described hereinbelow with reference to Table 1.

[29912] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2145 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[29913] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2146 (GAM2146) gene, which modulates

expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[29914] GAM2146 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2146 was detected is described hereinabove with reference to Figs. 2-8.

[29915] GAM2146 gene, herein designated GAM GENE, and GAM2146 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[29916] GAM2146 gene, herein designated GAM GENE, encodes a GAM2146 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2146 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2146 precursor RNA is designated SEQ ID:2123, and is provided hereinbelow with reference to the sequence listing part.

[29917] GAM2146 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2146 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[29918] An enzyme complex designated DICER COMPLEX, dices the GAM2146 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2146 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 83%) nucleotide sequence of GAM2146 RNA is designated SEQ ID:4738, and is provided hereinbelow with reference to the sequence listing part.

[29919] GAM2146 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2146 target RNA, herein designated GAM TARGET RNA. GAM2146 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[29920] GAM2146 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2146 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2146 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an

illustration only, and is not meant to be limiting GAM2146 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2146 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[29921] The complementary binding of GAM2146 RNA, herein designated GAM RNA, to target binding sites on GAM2146 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2146 target RNA, herein designated GAM TARGET RNA, into GAM2146 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[29922] It is appreciated that GAM2146 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2146 target genes. The mRNA of each one of this plurality of GAM2146 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2146 RNA, herein designated GAM RNA, and which when bound by GAM2146 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2146 target proteins.

[29923] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition

exerted by GAM2146 gene, herein designated GAM GENE, on one or more GAM2146 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[29924] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2146 correlate with, and may be deduced from, the identity of the target genes which GAM2146 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[29925] Nucleotide sequences of the GAM2146 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2146 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2146 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2146 are further described hereinbelow with reference to Table 1.

[29926] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2146 RNA, herein designated GAM RNA, are described hereinbelow

with reference to Table 2.

[29927] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2147 (GAM2147) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[29928] GAM2147 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2147 was detected is described hereinabove with reference to Figs. 2-8.

[29929] GAM2147 gene, herein designated GAM GENE, and GAM2147 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[29930] GAM2147 gene, herein designated GAM GENE, encodes a GAM2147 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2147 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2147 precursor RNA is designated SEQ ID:2124, and is provided hereinbelow with reference to the sequence listing part.

[29931] GAM2147 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2147 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA

encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[29932] An enzyme complex designated DICER COMPLEX, dices the GAM2147 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2147 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 76%) nucleotide sequence of GAM2147 RNA is designated SEQ ID:4737, and is provided hereinbelow with reference to the sequence listing part.

[29933] GAM2147 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2147 target RNA, herein designated GAM TARGET RNA. GAM2147 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[29934] GAM2147 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2147 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2147 RNA,

herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2147 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2147 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[29935] The complementary binding of GAM2147 RNA, herein designated GAM RNA, to target binding sites on GAM2147 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2147 target RNA, herein designated GAM TARGET RNA, into GAM2147 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[29936] It is appreciated that GAM2147 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2147 target genes. The mRNA of each one of this plurality of GAM2147 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2147 RNA, herein designated GAM RNA, and which when bound by GAM2147 RNA, herein designated GAM RNA,

causes inhibition of translation of respective one or more GAM2147 target proteins.

[29937] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2147 gene, herein designated GAM GENE, on one or more GAM2147 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[29938] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2147 correlate with, and may be deduced from, the identity of the target genes which GAM2147 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[29939] Nucleotide sequences of the GAM2147 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2147 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2147 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2147 are further described hereinbelow with reference to Table 1.

[29940] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2147 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[29941] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2148 (GAM2148) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[29942] GAM2148 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2148 was detected is described hereinabove with reference to Figs. 2-8.

[29943] GAM2148 gene, herein designated GAM GENE, and GAM2148 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[29944] GAM2148 gene, herein designated GAM GENE, encodes a GAM2148 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2148 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2148 precursor RNA is designated SEQ ID:2125, and is provided hereinbelow with reference to the sequence listing part.

[29945] GAM2148 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2148 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[29946] An enzyme complex designated DICER COMPLEX, dices the GAM2148 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2148 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM2148 RNA is designated SEQ ID:4740, and is provided hereinbelow with reference to the sequence listing part.

[29947] GAM2148 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2148 target RNA, herein designated GAM TARGET RNA. GAM2148 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[29948] GAM2148 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2148 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2148 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2148 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2148 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[29949] The complementary binding of GAM2148 RNA, herein designated GAM RNA, to target binding sites on GAM2148 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2148 target RNA, herein designated GAM TARGET RNA, into GAM2148 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[29950] It is appreciated that GAM2148 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2148 target genes. The

mRNA of each one of this plurality of GAM2148 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2148 RNA, herein designated GAM RNA, and which when bound by GAM2148 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2148 target proteins.

[29951] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2148 gene, herein designated GAM GENE, on one or more GAM2148 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[29952] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2148 correlate with, and may be deduced from, the identity of the target genes which GAM2148 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[29953] Nucleotide sequences of the GAM2148 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2148 RNA, herein

designated GAM RNA, and a schematic representation of the secondary folding of GAM2148 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2148 are further described hereinbelow with reference to Table 1.

[29954] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2148 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[29955] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2149 (GAM2149) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[29956] GAM2149 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2149 was detected is described hereinabove with reference to Figs. 2-8.

[29957] GAM2149 gene, herein designated GAM GENE, and GAM2149 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[29958] GAM2149 gene, herein designated GAM GENE, encodes a GAM2149 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2149 precursor RNA,

herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2149 precursor RNA is designated SEQ ID:2126, and is provided hereinbelow with reference to the sequence listing part.

[29959] GAM2149 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2149 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[29960] An enzyme complex designated DICER COMPLEX, dices the GAM2149 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2149 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 81%) nucleotide sequence of GAM2149 RNA is designated SEQ ID:4739, and is provided hereinbelow with reference to the sequence listing part.

[29961] GAM2149 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2149 target RNA, herein designated GAM TARGET RNA. GAM2149 target RNA, herein designated GAM

TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[29962] GAM2149 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2149 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2149 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2149 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2149 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[29963] The complementary binding of GAM2149 RNA, herein designated GAM RNA, to target binding sites on GAM2149 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2149 target RNA, herein designated GAM TARGET RNA, into GAM2149 target protein, herein

designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[29964] It is appreciated that GAM2149 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2149 target genes. The mRNA of each one of this plurality of GAM2149 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2149 RNA, herein designated GAM RNA, and which when bound by GAM2149 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2149 target proteins.

[29965] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2149 gene, herein designated GAM GENE, on one or more GAM2149 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[29966] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2149 correlate with, and may be deduced from, the identity of the target

genes which GAM2149 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[29967] Nucleotide sequences of the GAM2149 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2149 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2149 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2149 are further described hereinbelow with reference to Table 1.

[29968] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2149 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[29969] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2150 (GAM2150) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[29970] GAM2150 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2150 was detected is described hereinabove with reference to Figs. 2-8.

[29971] GAM2150 gene, herein designated GAM GENE, and GAM2150 target gene, herein designated GAM TARGET GENE, are human genes contained in the

human genome.

[29972] GAM2150 gene, herein designated GAM GENE, encodes a GAM2150 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2150 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2150 precursor RNA is designated SEQ ID:2127, and is provided hereinbelow with reference to the sequence listing part.

[29973] GAM2150 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2150 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[29974] An enzyme complex designated DICER COMPLEX, dices the GAM2150 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2150 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 84%) nucleotide sequence of GAM2150 RNA is designated SEQ ID:4741, and is provided

hereinbelow with reference to the sequence listing part.

[29975] GAM2150 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2150 target RNA, herein designated GAM TARGET RNA. GAM2150 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[29976] GAM2150 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2150 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2150 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2150 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2150 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[29977] The complementary binding of GAM2150 RNA, herein designated GAM RNA, to target binding sites on GAM2150 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2150 target RNA, herein designated GAM TARGET RNA, into GAM2150 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[29978] It is appreciated that GAM2150 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2150 target genes. The mRNA of each one of this plurality of GAM2150 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2150 RNA, herein designated GAM RNA, and which when bound by GAM2150 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2150 target proteins.

[29979] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2150 gene, herein designated GAM GENE, on one or more GAM2150 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding

sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[29980] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2150 correlate with, and may be deduced from, the identity of the target genes which GAM2150 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[29981] Nucleotide sequences of the GAM2150 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2150 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2150 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2150 are further described hereinbelow with reference to Table 1.

[29982] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2150 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[29983] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2151 (GAM2151) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[29984] GAM2151 is a novel bioinformatically detected regulatory, non protein

coding, micro RNA (miRNA) gene. The method by which GAM2151 was detected is described hereinabove with reference to Figs. 2-8.

[29985] GAM2151 gene, herein designated GAM GENE, and GAM2151 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[29986] GAM2151 gene, herein designated GAM GENE, encodes a GAM2151 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2151 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2151 precursor RNA is designated SEQ ID:2128, and is provided hereinbelow with reference to the sequence listing part.

[29987] GAM2151 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2151 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[29988] An enzyme complex designated DICER COMPLEX, dices the GAM2151 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2151 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin

structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 84%) nucleotide sequence of GAM2151 RNA is designated SEQ ID:4742, and is provided hereinbelow with reference to the sequence listing part.

[29989] GAM2151 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2151 target RNA, herein designated GAM TARGET RNA. GAM2151 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[29990] GAM2151 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2151 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2151 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2151 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2151 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target

binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[29991] The complementary binding of GAM2151 RNA, herein designated GAM RNA, to target binding sites on GAM2151 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2151 target RNA, herein designated GAM TARGET RNA, into GAM2151 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[29992] It is appreciated that GAM2151 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2151 target genes. The mRNA of each one of this plurality of GAM2151 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2151 RNA, herein designated GAM RNA, and which when bound by GAM2151 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2151 target proteins.

[29993] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2151 gene, herein designated GAM GENE, on one or more GAM2151 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary

binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[29994] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2151 correlate with, and may be deduced from, the identity of the target genes which GAM2151 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[29995] Nucleotide sequences of the GAM2151 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2151 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2151 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2151 are further described hereinbelow with reference to Table 1.

[29996] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2151 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[29997] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2152 (GAM2152) gene, which modulates

expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[29998] GAM2152 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2152 was detected is described hereinabove with reference to Figs. 2-8.

[29999] GAM2152 gene, herein designated GAM GENE, and GAM2152 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[30000] GAM2152 gene, herein designated GAM GENE, encodes a GAM2152 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2152 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2152 precursor RNA is designated SEQ ID:2129, and is provided hereinbelow with reference to the sequence listing part.

[30001] GAM2152 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2152 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[30002] An enzyme complex designated DICER COMPLEX, dices the GAM2152 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2152 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 78%) nucleotide sequence of GAM2152 RNA is designated SEQ ID:4743, and is provided hereinbelow with reference to the sequence listing part.

[30003] GAM2152 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2152 target RNA, herein designated GAM TARGET RNA. GAM2152 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[30004] GAM2152 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2152 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2152 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an

illustration only, and is not meant to be limiting GAM2152 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2152 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[30005] The complementary binding of GAM2152 RNA, herein designated GAM RNA, to target binding sites on GAM2152 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2152 target RNA, herein designated GAM TARGET RNA, into GAM2152 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[30006] It is appreciated that GAM2152 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2152 target genes. The mRNA of each one of this plurality of GAM2152 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2152 RNA, herein designated GAM RNA, and which when bound by GAM2152 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2152 target proteins.

[30007] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition

exerted by GAM2152 gene, herein designated GAM GENE, on one or more GAM2152 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[30008] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2152 correlate with, and may be deduced from, the identity of the target genes which GAM2152 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[30009] Nucleotide sequences of the GAM2152 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2152 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2152 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2152 are further described hereinbelow with reference to Table 1.

[30010] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2152 RNA, herein designated GAM RNA, are described hereinbelow

with reference to Table 2.

[30011] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2153 (GAM2153) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[30012] GAM2153 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2153 was detected is described hereinabove with reference to Figs. 2-8.

[30013] GAM2153 gene, herein designated GAM GENE, and GAM2153 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[30014] GAM2153 gene, herein designated GAM GENE, encodes a GAM2153 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2153 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2153 precursor RNA is designated SEQ ID:2130, and is provided hereinbelow with reference to the sequence listing part.

[30015] GAM2153 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2153 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA

encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[30016] An enzyme complex designated DICER COMPLEX, dices the GAM2153 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2153 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 78%) nucleotide sequence of GAM2153 RNA is designated SEQ ID:4744, and is provided hereinbelow with reference to the sequence listing part.

[30017] GAM2153 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2153 target RNA, herein designated GAM TARGET RNA. GAM2153 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[30018] GAM2153 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2153 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2153 RNA,

herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2153 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2153 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[30019] The complementary binding of GAM2153 RNA, herein designated GAM RNA, to target binding sites on GAM2153 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2153 target RNA, herein designated GAM TARGET RNA, into GAM2153 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[30020] It is appreciated that GAM2153 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2153 target genes. The mRNA of each one of this plurality of GAM2153 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2153 RNA, herein designated GAM RNA, and which when bound by GAM2153 RNA, herein designated GAM RNA,

causes inhibition of translation of respective one or more GAM2153 target proteins.

[30021] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2153 gene, herein designated GAM GENE, on one or more GAM2153 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[30022] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2153 correlate with, and may be deduced from, the identity of the target genes which GAM2153 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[30023] Nucleotide sequences of the GAM2153 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2153 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2153 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2153 are further described hereinbelow with reference to Table 1.

[30024] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2153 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[30025] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2154 (GAM2154) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[30026] GAM2154 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2154 was detected is described hereinabove with reference to Figs. 2-8.

[30027] GAM2154 gene, herein designated GAM GENE, and GAM2154 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[30028] GAM2154 gene, herein designated GAM GENE, encodes a GAM2154 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2154 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2154 precursor RNA is designated SEQ ID:2131, and is provided hereinbelow with reference to the sequence listing part.

[30029] GAM2154 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2154 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[30030] An enzyme complex designated DICER COMPLEX, dices the GAM2154 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2154 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 84%) nucleotide sequence of GAM2154 RNA is designated SEQ ID:4745, and is provided hereinbelow with reference to the sequence listing part.

[30031] GAM2154 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2154 target RNA, herein designated GAM TARGET RNA. GAM2154 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[30032] GAM2154 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2154 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2154 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2154 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2154 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[30033] The complementary binding of GAM2154 RNA, herein designated GAM RNA, to target binding sites on GAM2154 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2154 target RNA, herein designated GAM TARGET RNA, into GAM2154 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[30034] It is appreciated that GAM2154 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2154 target genes. The

mRNA of each one of this plurality of GAM2154 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2154 RNA, herein designated GAM RNA, and which when bound by GAM2154 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2154 target proteins.

[30035] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2154 gene, herein designated GAM GENE, on one or more GAM2154 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[30036] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2154 correlate with, and may be deduced from, the identity of the target genes which GAM2154 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[30037] Nucleotide sequences of the GAM2154 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2154 RNA, herein

designated GAM RNA, and a schematic representation of the secondary folding of GAM2154 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2154 are further described hereinbelow with reference to Table 1.

[30038] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2154 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[30039] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2155 (GAM2155) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[30040] GAM2155 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2155 was detected is described hereinabove with reference to Figs. 2-8.

[30041] GAM2155 gene, herein designated GAM GENE, and GAM2155 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[30042] GAM2155 gene, herein designated GAM GENE, encodes a GAM2155 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2155 precursor RNA,

herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2155 precursor RNA is designated SEQ ID:2132, and is provided hereinbelow with reference to the sequence listing part.

[30043] GAM2155 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2155 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[30044] An enzyme complex designated DICER COMPLEX, dices the GAM2155 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2155 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 84%) nucleotide sequence of GAM2155 RNA is designated SEQ ID:4747, and is provided hereinbelow with reference to the sequence listing part.

[30045] GAM2155 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2155 target RNA, herein designated GAM TARGET RNA. GAM2155 target RNA, herein designated GAM

TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[30046] GAM2155 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2155 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2155 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2155 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2155 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[30047] The complementary binding of GAM2155 RNA, herein designated GAM RNA, to target binding sites on GAM2155 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2155 target RNA, herein designated GAM TARGET RNA, into GAM2155 target protein, herein

designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[30048] It is appreciated that GAM2155 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2155 target genes. The mRNA of each one of this plurality of GAM2155 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2155 RNA, herein designated GAM RNA, and which when bound by GAM2155 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2155 target proteins.

[30049] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2155 gene, herein designated GAM GENE, on one or more GAM2155 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[30050] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2155 correlate with, and may be deduced from, the identity of the target

genes which GAM2155 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[30051] Nucleotide sequences of the GAM2155 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2155 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2155 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2155 are further described hereinbelow with reference to Table 1.

[30052] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2155 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[30053] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2156 (GAM2156) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[30054] GAM2156 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2156 was detected is described hereinabove with reference to Figs. 2-8.

[30055] GAM2156 gene, herein designated GAM GENE, and GAM2156 target gene, herein designated GAM TARGET GENE, are human genes contained in the

human genome.

[30056] GAM2156 gene, herein designated GAM GENE, encodes a GAM2156 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2156 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2156 precursor RNA is designated SEQ ID:2133, and is provided hereinbelow with reference to the sequence listing part.

[30057] GAM2156 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2156 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[30058] An enzyme complex designated DICER COMPLEX, dices the GAM2156 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2156 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 79%) nucleotide sequence of GAM2156 RNA is designated SEQ ID:4746, and is provided

hereinbelow with reference to the sequence listing part.

[30059] GAM2156 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2156 target RNA, herein designated GAM TARGET RNA. GAM2156 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[30060] GAM2156 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2156 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2156 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2156 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2156 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[30061] The complementary binding of GAM2156 RNA, herein designated GAM RNA, to target binding sites on GAM2156 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2156 target RNA, herein designated GAM TARGET RNA, into GAM2156 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[30062] It is appreciated that GAM2156 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2156 target genes. The mRNA of each one of this plurality of GAM2156 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2156 RNA, herein designated GAM RNA, and which when bound by GAM2156 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2156 target proteins.

[30063] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2156 gene, herein designated GAM GENE, on one or more GAM2156 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding

sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[30064] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2156 correlate with, and may be deduced from, the identity of the target genes which GAM2156 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[30065] Nucleotide sequences of the GAM2156 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2156 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2156 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2156 are further described hereinbelow with reference to Table 1.

[30066] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2156 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[30067] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2157 (GAM2157) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[30068] GAM2157 is a novel bioinformatically detected regulatory, non protein

coding, micro RNA (miRNA) gene. The method by which GAM2157 was detected is described hereinabove with reference to Figs. 2-8.

[30069] GAM2157 gene, herein designated GAM GENE, and GAM2157 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[30070] GAM2157 gene, herein designated GAM GENE, encodes a GAM2157 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2157 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2157 precursor RNA is designated SEQ ID:2134, and is provided hereinbelow with reference to the sequence listing part.

[30071] GAM2157 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2157 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[30072] An enzyme complex designated DICER COMPLEX, dices the GAM2157 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2157 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin

structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 81%) nucleotide sequence of GAM2157 RNA is designated SEQ ID:4748, and is provided hereinbelow with reference to the sequence listing part.

[30073] GAM2157 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2157 target RNA, herein designated GAM TARGET RNA. GAM2157 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[30074] GAM2157 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2157 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2157 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2157 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2157 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target

binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[30075] The complementary binding of GAM2157 RNA, herein designated GAM RNA, to target binding sites on GAM2157 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2157 target RNA, herein designated GAM TARGET RNA, into GAM2157 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[30076] It is appreciated that GAM2157 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2157 target genes. The mRNA of each one of this plurality of GAM2157 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2157 RNA, herein designated GAM RNA, and which when bound by GAM2157 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2157 target proteins.

[30077] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2157 gene, herein designated GAM GENE, on one or more GAM2157 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary

binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[30078] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2157 correlate with, and may be deduced from, the identity of the target genes which GAM2157 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[30079] Nucleotide sequences of the GAM2157 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2157 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2157 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2157 are further described hereinbelow with reference to Table 1.

[30080] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2157 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[30081] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2158 (GAM2158) gene, which modulates

expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[30082] GAM2158 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2158 was detected is described hereinabove with reference to Figs. 2-8.

[30083] GAM2158 gene, herein designated GAM GENE, and GAM2158 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[30084] GAM2158 gene, herein designated GAM GENE, encodes a GAM2158 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2158 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2158 precursor RNA is designated SEQ ID:2135, and is provided hereinbelow with reference to the sequence listing part.

[30085] GAM2158 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2158 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[30086] An enzyme complex designated DICER COMPLEX, dices the GAM2158 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2158 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 78%) nucleotide sequence of GAM2158 RNA is designated SEQ ID:4750, and is provided hereinbelow with reference to the sequence listing part.

[30087] GAM2158 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2158 target RNA, herein designated GAM TARGET RNA. GAM2158 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[30088] GAM2158 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2158 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2158 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an

illustration only, and is not meant to be limiting GAM2158 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2158 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[30089] The complementary binding of GAM2158 RNA, herein designated GAM RNA, to target binding sites on GAM2158 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2158 target RNA, herein designated GAM TARGET RNA, into GAM2158 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[30090] It is appreciated that GAM2158 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2158 target genes. The mRNA of each one of this plurality of GAM2158 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2158 RNA, herein designated GAM RNA, and which when bound by GAM2158 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2158 target proteins.

[30091] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition

exerted by GAM2158 gene, herein designated GAM GENE, on one or more GAM2158 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[30092] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2158 correlate with, and may be deduced from, the identity of the target genes which GAM2158 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[30093] Nucleotide sequences of the GAM2158 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2158 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2158 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2158 are further described hereinbelow with reference to Table 1.

[30094] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2158 RNA, herein designated GAM RNA, are described hereinbelow

with reference to Table 2.

[30095] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2159 (GAM2159) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[30096] GAM2159 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2159 was detected is described hereinabove with reference to Figs. 2-8.

[30097] GAM2159 gene, herein designated GAM GENE, and GAM2159 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[30098] GAM2159 gene, herein designated GAM GENE, encodes a GAM2159 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2159 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2159 precursor RNA is designated SEQ ID:2136, and is provided hereinbelow with reference to the sequence listing part.

[30099] GAM2159 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2159 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA

encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[30100] An enzyme complex designated DICER COMPLEX, dices the GAM2159 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2159 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 78%) nucleotide sequence of GAM2159 RNA is designated SEQ ID:4749, and is provided hereinbelow with reference to the sequence listing part.

[30101] GAM2159 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2159 target RNA, herein designated GAM TARGET RNA. GAM2159 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[30102] GAM2159 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2159 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2159 RNA,

herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2159 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2159 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[30103] The complementary binding of GAM2159 RNA, herein designated GAM RNA, to target binding sites on GAM2159 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2159 target RNA, herein designated GAM TARGET RNA, into GAM2159 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[30104] It is appreciated that GAM2159 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2159 target genes. The mRNA of each one of this plurality of GAM2159 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2159 RNA, herein designated GAM RNA, and which when bound by GAM2159 RNA, herein designated GAM RNA,

causes inhibition of translation of respective one or more GAM2159 target proteins.

[30105] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2159 gene, herein designated GAM GENE, on one or more GAM2159 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[30106] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2159 correlate with, and may be deduced from, the identity of the target genes which GAM2159 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[30107] Nucleotide sequences of the GAM2159 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2159 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2159 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2159 are further described hereinbelow with reference to Table 1.

[30108] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2159 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[30109] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2160 (GAM2160) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[30110] GAM2160 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2160 was detected is described hereinabove with reference to Figs. 2-8.

[30111] GAM2160 gene, herein designated GAM GENE, and GAM2160 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[30112] GAM2160 gene, herein designated GAM GENE, encodes a GAM2160 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2160 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2160 precursor RNA is designated SEQ ID:2137, and is provided hereinbelow with reference to the sequence listing part.

[30113] GAM2160 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2160 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[30114] An enzyme complex designated DICER COMPLEX, dices the GAM2160 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2160 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 81%) nucleotide sequence of GAM2160 RNA is designated SEQ ID:4751, and is provided hereinbelow with reference to the sequence listing part.

[30115] GAM2160 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2160 target RNA, herein designated GAM TARGET RNA. GAM2160 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[30116] GAM2160 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2160 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2160 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2160 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2160 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[30117] The complementary binding of GAM2160 RNA, herein designated GAM RNA, to target binding sites on GAM2160 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2160 target RNA, herein designated GAM TARGET RNA, into GAM2160 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[30118] It is appreciated that GAM2160 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2160 target genes. The

mRNA of each one of this plurality of GAM2160 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2160 RNA, herein designated GAM RNA, and which when bound by GAM2160 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2160 target proteins.

[30119] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2160 gene, herein designated GAM GENE, on one or more GAM2160 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[30120] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2160 correlate with, and may be deduced from, the identity of the target genes which GAM2160 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[30121] Nucleotide sequences of the GAM2160 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2160 RNA, herein

designated GAM RNA, and a schematic representation of the secondary folding of GAM2160 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2160 are further described hereinbelow with reference to Table 1.

[30122] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2160 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[30123] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2161 (GAM2161) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[30124] GAM2161 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2161 was detected is described hereinabove with reference to Figs. 2-8.

[30125] GAM2161 gene, herein designated GAM GENE, and GAM2161 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[30126] GAM2161 gene, herein designated GAM GENE, encodes a GAM2161 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2161 precursor RNA,

herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2161 precursor RNA is designated SEQ ID:2138, and is provided hereinbelow with reference to the sequence listing part.

[30127] GAM2161 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2161 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[30128] An enzyme complex designated DICER COMPLEX, dices the GAM2161 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2161 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 82%) nucleotide sequence of GAM2161 RNA is designated SEQ ID:4752, and is provided hereinbelow with reference to the sequence listing part.

[30129] GAM2161 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2161 target RNA, herein designated GAM TARGET RNA. GAM2161 target RNA, herein designated GAM

TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[30130] GAM2161 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2161 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2161 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2161 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2161 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[30131] The complementary binding of GAM2161 RNA, herein designated GAM RNA, to target binding sites on GAM2161 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2161 target RNA, herein designated GAM TARGET RNA, into GAM2161 target protein, herein

designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[30132] It is appreciated that GAM2161 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2161 target genes. The mRNA of each one of this plurality of GAM2161 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2161 RNA, herein designated GAM RNA, and which when bound by GAM2161 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2161 target proteins.

[30133] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2161 gene, herein designated GAM GENE, on one or more GAM2161 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[30134] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2161 correlate with, and may be deduced from, the identity of the target

genes which GAM2161 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[30135] Nucleotide sequences of the GAM2161 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2161 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2161 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2161 are further described hereinbelow with reference to Table 1.

[30136] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2161 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[30137] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2162 (GAM2162) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[30138] GAM2162 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2162 was detected is described hereinabove with reference to Figs. 2-8.

[30139] GAM2162 gene, herein designated GAM GENE, and GAM2162 target gene, herein designated GAM TARGET GENE, are human genes contained in the

human genome.

[30140] GAM2162 gene, herein designated GAM GENE, encodes a GAM2162 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2162 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2162 precursor RNA is designated SEQ ID:2139, and is provided hereinbelow with reference to the sequence listing part.

[30141] GAM2162 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2162 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[30142] An enzyme complex designated DICER COMPLEX, dices the GAM2162 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2162 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 80%) nucleotide sequence of GAM2162 RNA is designated SEQ ID:4753, and is provided

hereinbelow with reference to the sequence listing part.

[30143] GAM2162 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2162 target RNA, herein designated GAM TARGET RNA. GAM2162 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[30144] GAM2162 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2162 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2162 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2162 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2162 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[30145] The complementary binding of GAM2162 RNA, herein designated GAM RNA, to target binding sites on GAM2162 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2162 target RNA, herein designated GAM TARGET RNA, into GAM2162 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[30146] It is appreciated that GAM2162 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2162 target genes. The mRNA of each one of this plurality of GAM2162 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2162 RNA, herein designated GAM RNA, and which when bound by GAM2162 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2162 target proteins.

[30147] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2162 gene, herein designated GAM GENE, on one or more GAM2162 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding

sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[30148] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2162 correlate with, and may be deduced from, the identity of the target genes which GAM2162 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[30149] Nucleotide sequences of the GAM2162 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2162 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2162 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2162 are further described hereinbelow with reference to Table 1.

[30150] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2162 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[30151] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2163 (GAM2163) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[30152] GAM2163 is a novel bioinformatically detected regulatory, non protein

coding, micro RNA (miRNA) gene. The method by which GAM2163 was detected is described hereinabove with reference to Figs. 2-8.

[30153] GAM2163 gene, herein designated GAM GENE, and GAM2163 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[30154] GAM2163 gene, herein designated GAM GENE, encodes a GAM2163 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2163 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2163 precursor RNA is designated SEQ ID:2140, and is provided hereinbelow with reference to the sequence listing part.

[30155] GAM2163 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2163 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[30156] An enzyme complex designated DICER COMPLEX, dices the GAM2163 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2163 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin

structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 82%) nucleotide sequence of GAM2163 RNA is designated SEQ ID:4754, and is provided hereinbelow with reference to the sequence listing part.

[30157] GAM2163 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2163 target RNA, herein designated GAM TARGET RNA. GAM2163 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[30158] GAM2163 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2163 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2163 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2163 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2163 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target

binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[30159] The complementary binding of GAM2163 RNA, herein designated GAM RNA, to target binding sites on GAM2163 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2163 target RNA, herein designated GAM TARGET RNA, into GAM2163 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[30160] It is appreciated that GAM2163 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2163 target genes. The mRNA of each one of this plurality of GAM2163 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2163 RNA, herein designated GAM RNA, and which when bound by GAM2163 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2163 target proteins.

[30161] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2163 gene, herein designated GAM GENE, on one or more GAM2163 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary

binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[30162] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2163 correlate with, and may be deduced from, the identity of the target genes which GAM2163 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[30163] Nucleotide sequences of the GAM2163 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2163 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2163 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2163 are further described hereinbelow with reference to Table 1.

[30164] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2163 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[30165] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2164 (GAM2164) gene, which modulates

expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[30166] GAM2164 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2164 was detected is described hereinabove with reference to Figs. 2-8.

[30167] GAM2164 gene, herein designated GAM GENE, and GAM2164 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[30168] GAM2164 gene, herein designated GAM GENE, encodes a GAM2164 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2164 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2164 precursor RNA is designated SEQ ID:2141, and is provided hereinbelow with reference to the sequence listing part.

[30169] GAM2164 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2164 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[30170] An enzyme complex designated DICER COMPLEX, dices the GAM2164 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2164 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM2164 RNA is designated SEQ ID:4755, and is provided hereinbelow with reference to the sequence listing part.

[30171] GAM2164 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2164 target RNA, herein designated GAM TARGET RNA. GAM2164 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[30172] GAM2164 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2164 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2164 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an

illustration only, and is not meant to be limiting GAM2164 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2164 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[30173] The complementary binding of GAM2164 RNA, herein designated GAM RNA, to target binding sites on GAM2164 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2164 target RNA, herein designated GAM TARGET RNA, into GAM2164 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[30174] It is appreciated that GAM2164 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2164 target genes. The mRNA of each one of this plurality of GAM2164 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2164 RNA, herein designated GAM RNA, and which when bound by GAM2164 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2164 target proteins.

[30175] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition

exerted by GAM2164 gene, herein designated GAM GENE, on one or more GAM2164 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[30176] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2164 correlate with, and may be deduced from, the identity of the target genes which GAM2164 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[30177] Nucleotide sequences of the GAM2164 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2164 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2164 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2164 are further described hereinbelow with reference to Table 1.

[30178] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2164 RNA, herein designated GAM RNA, are described hereinbelow

with reference to Table 2.

[30179] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2165 (GAM2165) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[30180] GAM2165 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2165 was detected is described hereinabove with reference to Figs. 2-8.

[30181] GAM2165 gene, herein designated GAM GENE, and GAM2165 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[30182] GAM2165 gene, herein designated GAM GENE, encodes a GAM2165 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2165 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2165 precursor RNA is designated SEQ ID:2142, and is provided hereinbelow with reference to the sequence listing part.

[30183] GAM2165 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2165 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA

encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[30184] An enzyme complex designated DICER COMPLEX, dices the GAM2165 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2165 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 81%) nucleotide sequence of GAM2165 RNA is designated SEQ ID:4756, and is provided hereinbelow with reference to the sequence listing part.

[30185] GAM2165 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2165 target RNA, herein designated GAM TARGET RNA. GAM2165 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[30186] GAM2165 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2165 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2165 RNA,

herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2165 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2165 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[30187] The complementary binding of GAM2165 RNA, herein designated GAM RNA, to target binding sites on GAM2165 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2165 target RNA, herein designated GAM TARGET RNA, into GAM2165 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[30188] It is appreciated that GAM2165 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2165 target genes. The mRNA of each one of this plurality of GAM2165 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2165 RNA, herein designated GAM RNA, and which when bound by GAM2165 RNA, herein designated GAM RNA,

causes inhibition of translation of respective one or more GAM2165 target proteins.

[30189] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2165 gene, herein designated GAM GENE, on one or more GAM2165 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[30190] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2165 correlate with, and may be deduced from, the identity of the target genes which GAM2165 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[30191] Nucleotide sequences of the GAM2165 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2165 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2165 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2165 are further described hereinbelow with reference to Table 1.

[30192] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2165 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[30193] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2166 (GAM2166) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[30194] GAM2166 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2166 was detected is described hereinabove with reference to Figs. 2-8.

[30195] GAM2166 gene, herein designated GAM GENE, and GAM2166 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[30196] GAM2166 gene, herein designated GAM GENE, encodes a GAM2166 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2166 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2166 precursor RNA is designated SEQ ID:2143, and is provided hereinbelow with reference to the sequence listing part.

[30197] GAM2166 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2166 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[30198] An enzyme complex designated DICER COMPLEX, dices the GAM2166 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2166 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 86%) nucleotide sequence of GAM2166 RNA is designated SEQ ID:4757, and is provided hereinbelow with reference to the sequence listing part.

[30199] GAM2166 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2166 target RNA, herein designated GAM TARGET RNA. GAM2166 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[30200] GAM2166 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2166 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2166 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2166 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2166 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[30201] The complementary binding of GAM2166 RNA, herein designated GAM RNA, to target binding sites on GAM2166 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2166 target RNA, herein designated GAM TARGET RNA, into GAM2166 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[30202] It is appreciated that GAM2166 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2166 target genes. The

mRNA of each one of this plurality of GAM2166 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2166 RNA, herein designated GAM RNA, and which when bound by GAM2166 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2166 target proteins.

[30203] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2166 gene, herein designated GAM GENE, on one or more GAM2166 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[30204] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2166 correlate with, and may be deduced from, the identity of the target genes which GAM2166 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[30205] Nucleotide sequences of the GAM2166 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2166 RNA, herein

designated GAM RNA, and a schematic representation of the secondary folding of GAM2166 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2166 are further described hereinbelow with reference to Table 1.

[30206] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2166 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[30207] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2167 (GAM2167) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[30208] GAM2167 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2167 was detected is described hereinabove with reference to Figs. 2-8.

[30209] GAM2167 gene, herein designated GAM GENE, and GAM2167 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[30210] GAM2167 gene, herein designated GAM GENE, encodes a GAM2167 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2167 precursor RNA,

herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2167 precursor RNA is designated SEQ ID:2144, and is provided hereinbelow with reference to the sequence listing part.

[30211] GAM2167 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2167 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[30212] An enzyme complex designated DICER COMPLEX, dices the GAM2167 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2167 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 87%) nucleotide sequence of GAM2167 RNA is designated SEQ ID:4758, and is provided hereinbelow with reference to the sequence listing part.

[30213] GAM2167 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2167 target RNA, herein designated GAM TARGET RNA. GAM2167 target RNA, herein designated GAM

TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[30214] GAM2167 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2167 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2167 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2167 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2167 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[30215] The complementary binding of GAM2167 RNA, herein designated GAM RNA, to target binding sites on GAM2167 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2167 target RNA, herein designated GAM TARGET RNA, into GAM2167 target protein, herein

designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[30216] It is appreciated that GAM2167 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2167 target genes. The mRNA of each one of this plurality of GAM2167 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2167 RNA, herein designated GAM RNA, and which when bound by GAM2167 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2167 target proteins.

[30217] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2167 gene, herein designated GAM GENE, on one or more GAM2167 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[30218] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2167 correlate with, and may be deduced from, the identity of the target

genes which GAM2167 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[30219] Nucleotide sequences of the GAM2167 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2167 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2167 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2167 are further described hereinbelow with reference to Table 1.

[30220] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2167 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[30221] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2168 (GAM2168) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[30222] GAM2168 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2168 was detected is described hereinabove with reference to Figs. 2-8.

[30223] GAM2168 gene, herein designated GAM GENE, and GAM2168 target gene, herein designated GAM TARGET GENE, are human genes contained in the

human genome.

[30224] GAM2168 gene, herein designated GAM GENE, encodes a GAM2168 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2168 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2168 precursor RNA is designated SEQ ID:2145, and is provided hereinbelow with reference to the sequence listing part.

[30225] GAM2168 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2168 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[30226] An enzyme complex designated DICER COMPLEX, dices the GAM2168 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2168 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 84%) nucleotide sequence of GAM2168 RNA is designated SEQ ID:4759, and is provided

hereinbelow with reference to the sequence listing part.

[30227] GAM2168 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2168 target RNA, herein designated GAM TARGET RNA. GAM2168 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[30228] GAM2168 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2168 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2168 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2168 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2168 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[30229] The complementary binding of GAM2168 RNA, herein designated GAM RNA, to target binding sites on GAM2168 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2168 target RNA, herein designated GAM TARGET RNA, into GAM2168 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[30230] It is appreciated that GAM2168 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2168 target genes. The mRNA of each one of this plurality of GAM2168 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2168 RNA, herein designated GAM RNA, and which when bound by GAM2168 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2168 target proteins.

[30231] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2168 gene, herein designated GAM GENE, on one or more GAM2168 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding

sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[30232] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2168 correlate with, and may be deduced from, the identity of the target genes which GAM2168 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[30233] Nucleotide sequences of the GAM2168 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2168 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2168 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2168 are further described hereinbelow with reference to Table 1.

[30234] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2168 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[30235] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2169 (GAM2169) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[30236] GAM2169 is a novel bioinformatically detected regulatory, non protein

coding, micro RNA (miRNA) gene. The method by which GAM2169 was detected is described hereinabove with reference to Figs. 2-8.

[30237] GAM2169 gene, herein designated GAM GENE, and GAM2169 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[30238] GAM2169 gene, herein designated GAM GENE, encodes a GAM2169 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2169 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2169 precursor RNA is designated SEQ ID:2146, and is provided hereinbelow with reference to the sequence listing part.

[30239] GAM2169 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2169 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[30240] An enzyme complex designated DICER COMPLEX, dices the GAM2169 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2169 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin

structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 79%) nucleotide sequence of GAM2169 RNA is designated SEQ ID:4760, and is provided hereinbelow with reference to the sequence listing part.

[30241] GAM2169 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2169 target RNA, herein designated GAM TARGET RNA. GAM2169 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[30242] GAM2169 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2169 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2169 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2169 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2169 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target

binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[30243] The complementary binding of GAM2169 RNA, herein designated GAM RNA, to target binding sites on GAM2169 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2169 target RNA, herein designated GAM TARGET RNA, into GAM2169 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[30244] It is appreciated that GAM2169 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2169 target genes. The mRNA of each one of this plurality of GAM2169 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2169 RNA, herein designated GAM RNA, and which when bound by GAM2169 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2169 target proteins.

[30245] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2169 gene, herein designated GAM GENE, on one or more GAM2169 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary

binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[30246] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2169 correlate with, and may be deduced from, the identity of the target genes which GAM2169 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[30247] Nucleotide sequences of the GAM2169 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2169 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2169 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2169 are further described hereinbelow with reference to Table 1.

[30248] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2169 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[30249] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2170 (GAM2170) gene, which modulates

expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[30250] GAM2170 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2170 was detected is described hereinabove with reference to Figs. 2-8.

[30251] GAM2170 gene, herein designated GAM GENE, and GAM2170 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[30252] GAM2170 gene, herein designated GAM GENE, encodes a GAM2170 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2170 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2170 precursor RNA is designated SEQ ID:2147, and is provided hereinbelow with reference to the sequence listing part.

[30253] GAM2170 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2170 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[30254] An enzyme complex designated DICER COMPLEX, dices the GAM2170 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2170 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 88%) nucleotide sequence of GAM2170 RNA is designated SEQ ID:4761, and is provided hereinbelow with reference to the sequence listing part.

[30255] GAM2170 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2170 target RNA, herein designated GAM TARGET RNA. GAM2170 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[30256] GAM2170 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2170 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2170 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an

illustration only, and is not meant to be limiting GAM2170 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2170 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[30257] The complementary binding of GAM2170 RNA, herein designated GAM RNA, to target binding sites on GAM2170 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2170 target RNA, herein designated GAM TARGET RNA, into GAM2170 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[30258] It is appreciated that GAM2170 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2170 target genes. The mRNA of each one of this plurality of GAM2170 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2170 RNA, herein designated GAM RNA, and which when bound by GAM2170 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2170 target proteins.

[30259] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition

exerted by GAM2170 gene, herein designated GAM GENE, on one or more GAM2170 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[30260] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2170 correlate with, and may be deduced from, the identity of the target genes which GAM2170 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[30261] Nucleotide sequences of the GAM2170 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2170 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2170 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2170 are further described hereinbelow with reference to Table 1.

[30262] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2170 RNA, herein designated GAM RNA, are described hereinbelow

with reference to Table 2.

[30263] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2171 (GAM2171) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[30264] GAM2171 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2171 was detected is described hereinabove with reference to Figs. 2-8.

[30265] GAM2171 gene, herein designated GAM GENE, and GAM2171 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[30266] GAM2171 gene, herein designated GAM GENE, encodes a GAM2171 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2171 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2171 precursor RNA is designated SEQ ID:2148, and is provided hereinbelow with reference to the sequence listing part.

[30267] GAM2171 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2171 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA

encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[30268] An enzyme complex designated DICER COMPLEX, dices the GAM2171 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2171 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 80%) nucleotide sequence of GAM2171 RNA is designated SEQ ID:4762, and is provided hereinbelow with reference to the sequence listing part.

[30269] GAM2171 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2171 target RNA, herein designated GAM TARGET RNA. GAM2171 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[30270] GAM2171 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2171 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2171 RNA,

herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2171 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2171 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[30271] The complementary binding of GAM2171 RNA, herein designated GAM RNA, to target binding sites on GAM2171 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2171 target RNA, herein designated GAM TARGET RNA, into GAM2171 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[30272] It is appreciated that GAM2171 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2171 target genes. The mRNA of each one of this plurality of GAM2171 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2171 RNA, herein designated GAM RNA, and which when bound by GAM2171 RNA, herein designated GAM RNA,

causes inhibition of translation of respective one or more GAM2171 target proteins.

[30273] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2171 gene, herein designated GAM GENE, on one or more GAM2171 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[30274] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2171 correlate with, and may be deduced from, the identity of the target genes which GAM2171 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[30275] Nucleotide sequences of the GAM2171 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2171 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2171 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2171 are further described hereinbelow with reference to Table 1.

[30276] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2171 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[30277] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2172 (GAM2172) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[30278] GAM2172 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2172 was detected is described hereinabove with reference to Figs. 2-8.

[30279] GAM2172 gene, herein designated GAM GENE, and GAM2172 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[30280] GAM2172 gene, herein designated GAM GENE, encodes a GAM2172 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2172 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2172 precursor RNA is designated SEQ ID:2149, and is provided hereinbelow with reference to the sequence listing part.

[30281] GAM2172 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2172 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[30282] An enzyme complex designated DICER COMPLEX, dices the GAM2172 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2172 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 78%) nucleotide sequence of GAM2172 RNA is designated SEQ ID:4763, and is provided hereinbelow with reference to the sequence listing part.

[30283] GAM2172 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2172 target RNA, herein designated GAM TARGET RNA. GAM2172 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[30284] GAM2172 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2172 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2172 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2172 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2172 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[30285] The complementary binding of GAM2172 RNA, herein designated GAM RNA, to target binding sites on GAM2172 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2172 target RNA, herein designated GAM TARGET RNA, into GAM2172 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[30286] It is appreciated that GAM2172 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2172 target genes. The

mRNA of each one of this plurality of GAM2172 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2172 RNA, herein designated GAM RNA, and which when bound by GAM2172 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2172 target proteins.

[30287] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2172 gene, herein designated GAM GENE, on one or more GAM2172 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[30288] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2172 correlate with, and may be deduced from, the identity of the target genes which GAM2172 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[30289] Nucleotide sequences of the GAM2172 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2172 RNA, herein

designated GAM RNA, and a schematic representation of the secondary folding of GAM2172 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2172 are further described hereinbelow with reference to Table 1.

[30290] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2172 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[30291] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2173 (GAM2173) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[30292] GAM2173 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2173 was detected is described hereinabove with reference to Figs. 2-8.

[30293] GAM2173 gene, herein designated GAM GENE, and GAM2173 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[30294] GAM2173 gene, herein designated GAM GENE, encodes a GAM2173 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2173 precursor RNA,

herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2173 precursor RNA is designated SEQ ID:2150, and is provided hereinbelow with reference to the sequence listing part.

[30295] GAM2173 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2173 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[30296] An enzyme complex designated DICER COMPLEX, dices the GAM2173 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2173 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 82%) nucleotide sequence of GAM2173 RNA is designated SEQ ID:4764, and is provided hereinbelow with reference to the sequence listing part.

[30297] GAM2173 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2173 target RNA, herein designated GAM TARGET RNA. GAM2173 target RNA, herein designated GAM

TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[30298] GAM2173 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2173 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2173 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2173 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2173 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[30299] The complementary binding of GAM2173 RNA, herein designated GAM RNA, to target binding sites on GAM2173 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2173 target RNA, herein designated GAM TARGET RNA, into GAM2173 target protein, herein

designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[30300] It is appreciated that GAM2173 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2173 target genes. The mRNA of each one of this plurality of GAM2173 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2173 RNA, herein designated GAM RNA, and which when bound by GAM2173 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2173 target proteins.

[30301] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2173 gene, herein designated GAM GENE, on one or more GAM2173 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[30302] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2173 correlate with, and may be deduced from, the identity of the target

genes which GAM2173 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[30303] Nucleotide sequences of the GAM2173 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2173 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2173 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2173 are further described hereinbelow with reference to Table 1.

[30304] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2173 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[30305] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2174 (GAM2174) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[30306] GAM2174 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2174 was detected is described hereinabove with reference to Figs. 2-8.

[30307] GAM2174 gene, herein designated GAM GENE, and GAM2174 target gene, herein designated GAM TARGET GENE, are human genes contained in the

human genome.

[30308] GAM2174 gene, herein designated GAM GENE, encodes a GAM2174 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2174 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2174 precursor RNA is designated SEQ ID:2151, and is provided hereinbelow with reference to the sequence listing part.

[30309] GAM2174 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2174 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[30310] An enzyme complex designated DICER COMPLEX, dices the GAM2174 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2174 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 79%) nucleotide sequence of GAM2174 RNA is designated SEQ ID:4765, and is provided

hereinbelow with reference to the sequence listing part.

[30311] GAM2174 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2174 target RNA, herein designated GAM TARGET RNA. GAM2174 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[30312] GAM2174 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2174 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2174 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2174 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2174 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[30313] The complementary binding of GAM2174 RNA, herein designated GAM RNA, to target binding sites on GAM2174 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2174 target RNA, herein designated GAM TARGET RNA, into GAM2174 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[30314] It is appreciated that GAM2174 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2174 target genes. The mRNA of each one of this plurality of GAM2174 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2174 RNA, herein designated GAM RNA, and which when bound by GAM2174 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2174 target proteins.

[30315] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2174 gene, herein designated GAM GENE, on one or more GAM2174 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding

sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[30316] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2174 correlate with, and may be deduced from, the identity of the target genes which GAM2174 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[30317] Nucleotide sequences of the GAM2174 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2174 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2174 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2174 are further described hereinbelow with reference to Table 1.

[30318] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2174 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[30319] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2175 (GAM2175) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[30320] GAM2175 is a novel bioinformatically detected regulatory, non protein

coding, micro RNA (miRNA) gene. The method by which GAM2175 was detected is described hereinabove with reference to Figs. 2-8.

[30321] GAM2175 gene, herein designated GAM GENE, and GAM2175 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[30322] GAM2175 gene, herein designated GAM GENE, encodes a GAM2175 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2175 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2175 precursor RNA is designated SEQ ID:2152, and is provided hereinbelow with reference to the sequence listing part.

[30323] GAM2175 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2175 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[30324] An enzyme complex designated DICER COMPLEX, dices the GAM2175 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2175 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin

structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 79%) nucleotide sequence of GAM2175 RNA is designated SEQ ID:4766, and is provided hereinbelow with reference to the sequence listing part.

[30325] GAM2175 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2175 target RNA, herein designated GAM TARGET RNA. GAM2175 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[30326] GAM2175 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2175 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2175 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2175 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2175 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target

binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[30327] The complementary binding of GAM2175 RNA, herein designated GAM RNA, to target binding sites on GAM2175 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2175 target RNA, herein designated GAM TARGET RNA, into GAM2175 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[30328] It is appreciated that GAM2175 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2175 target genes. The mRNA of each one of this plurality of GAM2175 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2175 RNA, herein designated GAM RNA, and which when bound by GAM2175 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2175 target proteins.

[30329] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2175 gene, herein designated GAM GENE, on one or more GAM2175 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary

binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[30330] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2175 correlate with, and may be deduced from, the identity of the target genes which GAM2175 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[30331] Nucleotide sequences of the GAM2175 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2175 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2175 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2175 are further described hereinbelow with reference to Table 1.

[30332] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2175 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[30333] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2176 (GAM2176) gene, which modulates

expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[30334] GAM2176 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2176 was detected is described hereinabove with reference to Figs. 2-8.

[30335] GAM2176 gene, herein designated GAM GENE, and GAM2176 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[30336] GAM2176 gene, herein designated GAM GENE, encodes a GAM2176 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2176 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2176 precursor RNA is designated SEQ ID:2153, and is provided hereinbelow with reference to the sequence listing part.

[30337] GAM2176 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2176 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[30338] An enzyme complex designated DICER COMPLEX, dices the GAM2176 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2176 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 79%) nucleotide sequence of GAM2176 RNA is designated SEQ ID:4767, and is provided hereinbelow with reference to the sequence listing part.

[30339] GAM2176 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2176 target RNA, herein designated GAM TARGET RNA. GAM2176 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[30340] GAM2176 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2176 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2176 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an

illustration only, and is not meant to be limiting GAM2176 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2176 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[30341] The complementary binding of GAM2176 RNA, herein designated GAM RNA, to target binding sites on GAM2176 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2176 target RNA, herein designated GAM TARGET RNA, into GAM2176 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[30342] It is appreciated that GAM2176 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2176 target genes. The mRNA of each one of this plurality of GAM2176 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2176 RNA, herein designated GAM RNA, and which when bound by GAM2176 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2176 target proteins.

[30343] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition

exerted by GAM2176 gene, herein designated GAM GENE, on one or more GAM2176 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[30344] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2176 correlate with, and may be deduced from, the identity of the target genes which GAM2176 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[30345] Nucleotide sequences of the GAM2176 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2176 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2176 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2176 are further described hereinbelow with reference to Table 1.

[30346] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2176 RNA, herein designated GAM RNA, are described hereinbelow

with reference to Table 2.

[30347] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2177 (GAM2177) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[30348] GAM2177 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2177 was detected is described hereinabove with reference to Figs. 2-8.

[30349] GAM2177 gene, herein designated GAM GENE, and GAM2177 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[30350] GAM2177 gene, herein designated GAM GENE, encodes a GAM2177 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2177 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2177 precursor RNA is designated SEQ ID:2154, and is provided hereinbelow with reference to the sequence listing part.

[30351] GAM2177 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2177 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA

encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[30352] An enzyme complex designated DICER COMPLEX, dices the GAM2177 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2177 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM2177 RNA is designated SEQ ID:4768, and is provided hereinbelow with reference to the sequence listing part.

[30353] GAM2177 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2177 target RNA, herein designated GAM TARGET RNA. GAM2177 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[30354] GAM2177 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2177 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2177 RNA,

herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2177 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2177 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[30355] The complementary binding of GAM2177 RNA, herein designated GAM RNA, to target binding sites on GAM2177 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2177 target RNA, herein designated GAM TARGET RNA, into GAM2177 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[30356] It is appreciated that GAM2177 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2177 target genes. The mRNA of each one of this plurality of GAM2177 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2177 RNA, herein designated GAM RNA, and which when bound by GAM2177 RNA, herein designated GAM RNA,

causes inhibition of translation of respective one or more GAM2177 target proteins.

[30357] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2177 gene, herein designated GAM GENE, on one or more GAM2177 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[30358] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2177 correlate with, and may be deduced from, the identity of the target genes which GAM2177 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[30359] Nucleotide sequences of the GAM2177 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2177 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM2177 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2177 are further described hereinbelow with reference to Table 1.

[30360] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2177 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[30361] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2178 (GAM2178) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[30362] GAM2178 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2178 was detected is described hereinabove with reference to Figs. 2-8.

[30363] GAM2178 gene, herein designated GAM GENE, and GAM2178 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[30364] GAM2178 gene, herein designated GAM GENE, encodes a GAM2178 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2178 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2178 precursor RNA is designated SEQ ID:2155, and is provided hereinbelow with reference to the sequence listing part.

[30365] GAM2178 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2178 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[30366] An enzyme complex designated DICER COMPLEX, dices the GAM2178 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2178 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 87%) nucleotide sequence of GAM2178 RNA is designated SEQ ID:4769, and is provided hereinbelow with reference to the sequence listing part.

[30367] GAM2178 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2178 target RNA, herein designated GAM TARGET RNA. GAM2178 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[30368] GAM2178 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2178 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2178 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2178 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2178 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[30369] The complementary binding of GAM2178 RNA, herein designated GAM RNA, to target binding sites on GAM2178 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2178 target RNA, herein designated GAM TARGET RNA, into GAM2178 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[30370] It is appreciated that GAM2178 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2178 target genes. The

mRNA of each one of this plurality of GAM2178 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2178 RNA, herein designated GAM RNA, and which when bound by GAM2178 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2178 target proteins.

[30371] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2178 gene, herein designated GAM GENE, on one or more GAM2178 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[30372] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2178 correlate with, and may be deduced from, the identity of the target genes which GAM2178 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[30373] Nucleotide sequences of the GAM2178 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM2178 RNA, herein

designated GAM RNA, and a schematic representation of the secondary folding of GAM2178 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM2178 are further described hereinbelow with reference to Table 1.

[30374] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM2178 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[30375] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 2179 (GAM2179) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[30376] GAM2179 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM2179 was detected is described hereinabove with reference to Figs. 2-8.

[30377] GAM2179 gene, herein designated GAM GENE, and GAM2179 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[30378] GAM2179 gene, herein designated GAM GENE, encodes a GAM2179 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM2179 precursor RNA,

herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM2179 precursor RNA is designated SEQ ID:2156, and is provided hereinbelow with reference to the sequence listing part.

[30379] GAM2179 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM2179 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[30380] An enzyme complex designated DICER COMPLEX, dices the GAM2179 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM2179 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 80%) nucleotide sequence of GAM2179 RNA is designated SEQ ID:4770, and is provided hereinbelow with reference to the sequence listing part.

[30381] GAM2179 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM2179 target RNA, herein designated GAM TARGET RNA. GAM2179 target RNA, herein designated GAM

TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[30382] GAM2179 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM2179 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM2179 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM2179 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM2179 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[30383] The complementary binding of GAM2179 RNA, herein designated GAM RNA, to target binding sites on GAM2179 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM2179 target RNA, herein designated GAM TARGET RNA, into GAM2179 target protein, herein

designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[30384] It is appreciated that GAM2179 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM2179 target genes. The mRNA of each one of this plurality of GAM2179 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM2179 RNA, herein designated GAM RNA, and which when bound by GAM2179 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM2179 target proteins.

[30385] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM2179 gene, herein designated GAM GENE, on one or more GAM2179 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[30386] It is yet further appreciated that specific functions, and accordingly utilities, of GAM2179 correlate with, and may be deduced from, the identity of the target
